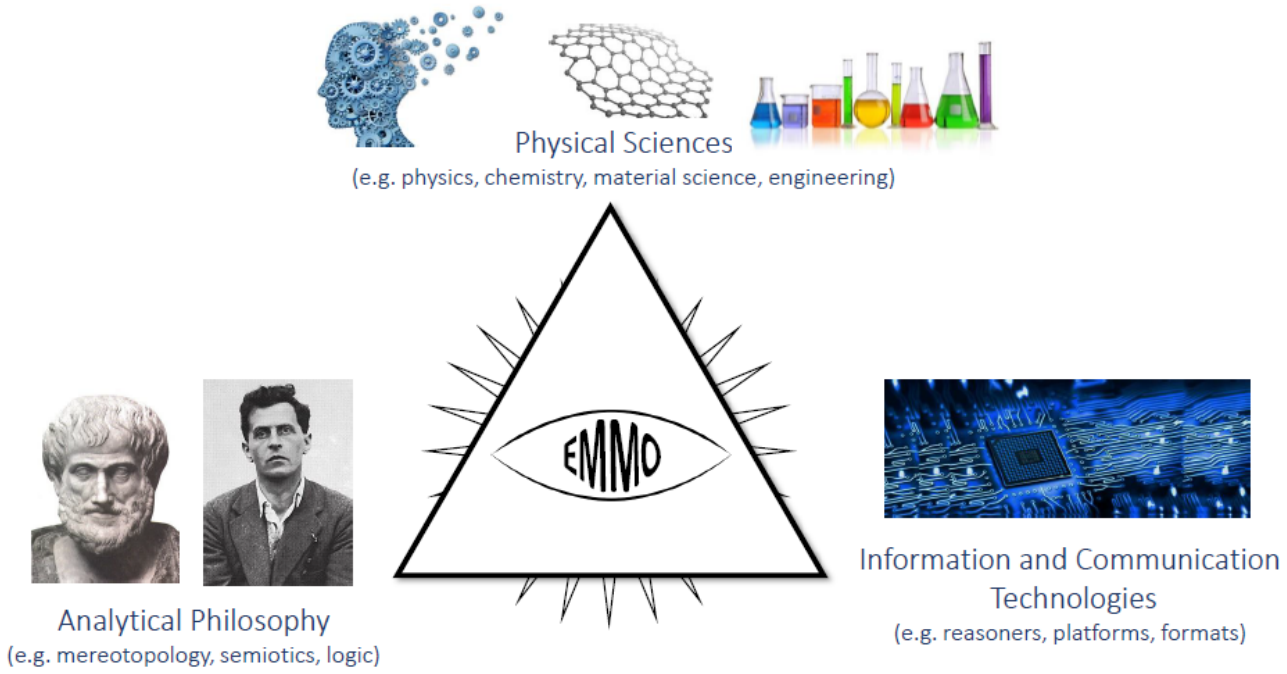
Europeean Materials Modelling Ontology

Version 1.0.0-beta

European Materials Modelling Counsil (EMMC)

October 17, 2020



Abstract

EMMO is an ontology that is created by the Europeean Materials Modelling Council (EMMC) to provide a formal way to describe the fundamental concepts of physics, chemistry and materials science. EMMO is designed to pave the road for semantic interoperability providing a generic common ground for describing materials, models and data that can be adapted by all domains.

It is a representational framework of predefined classes and axioms (ontology) provided by experts (EMMC) that enables end users (industry, research, academy) to represent real life physical entities (materials, devices), models and properties using ontological signs (individuals) in a standard way to facilitate interactions and exchanges (data, software, knowledge) between all involved material modelling and characterization communities and stakeholders.

Keywords: EMMO, materials science, modelling, characterisation, materials, ontology

Chapter 1

Introduction

EMMO is a multidisciplinary effort to develop a standard representational framework (the ontology) based on current materials modelling knowledge, including physical sciences, analytical philosophy and information and communication technologies. This multidisciplinarity is illustrated by the figure on the title page. It provides the connection between the physical world, materials characterisation world and materials modelling world.

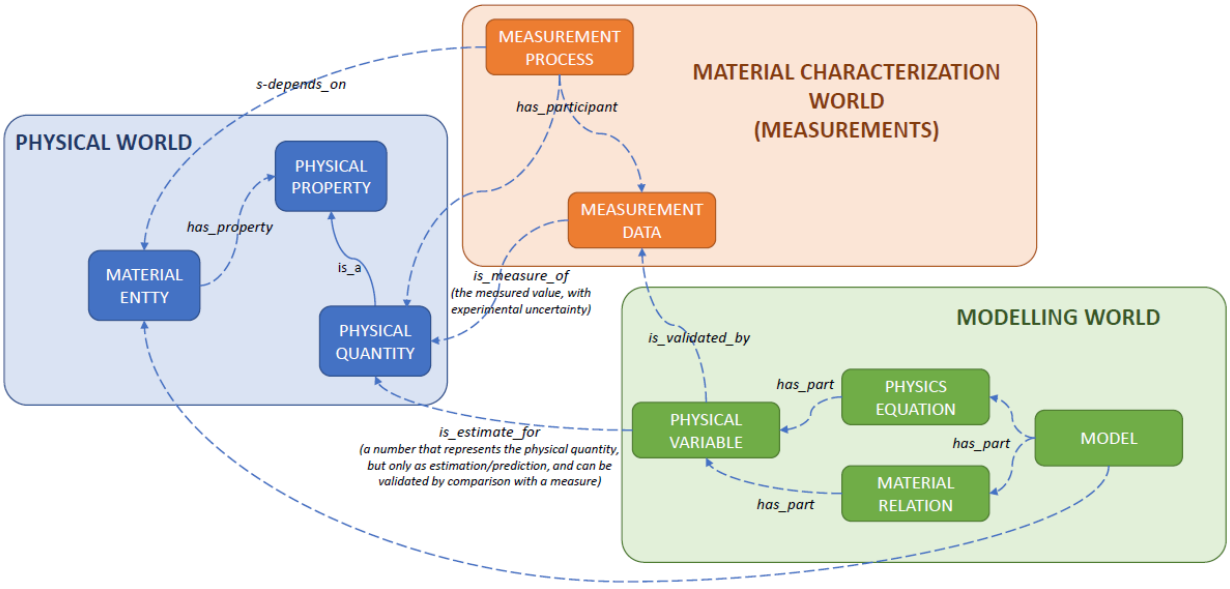

Figure 1.1: EMMO provides the connection between the physical world, materials characterisation world and materials modelling world.

EMMO is based on and is consistent with the Review of Materials Modelling, CEN Workshop Agreement and MODA template. However, while these efforts are written for humans, EMMO is defined using the Web Ontology Language (OWL), which is machine readable and allows for machine reasoning. In terms of semantic representation, EMMO brings everything to a much higher level than these foundations.

As illustrated in the figure below, EMMO covers all aspects of materials modelling and characterisation, including:

- the **material** itself, which must be described in a rigorous way
- the **observation process** involving an observer that percieves the real world (characterisation)
- the **properties** that are measured or modelled
- the **physics laws** that describe the material behaviour
- the **physical models** that approximate the physics laws
- the **solver** including the numerical discretisation method that leads to a solvable mathematical representation under certain simplifying assumptions
- the **numerical solver** that performs the calculations
- the **post processing** of experimental or simulated data

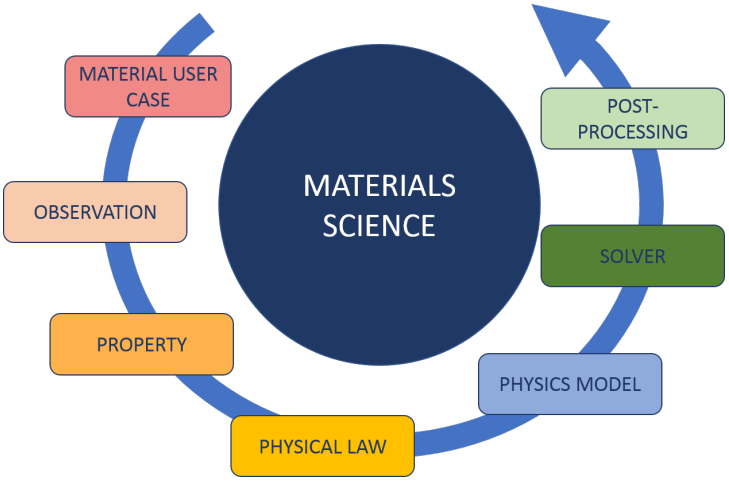

Figure 1.2: The aspects of materials modelling and characterisation covered by EMMO.

EMMO is released under the Creative Commons license and is available at emmo.info/. The OWL2-DL sources are available in RDF/XML format.

What is an ontology

In short, an ontology is a specification of a conceptualization. The word *ontology* has a long history in philosophy, in which it refers to the subject of existence. The so-called ontological argument for the existence of God was proposed by Anselm of Canterbury in 1078. He defined God as *"that than which nothing greater can be thought"*, and argued that *"if the greatest possible being exists in the mind, it must also exist in reality. If it only exists in the mind, then an even greater being must be possible – one which exists both in the mind and in reality"*. Even though this example has little to do with todays use of ontologies in e.g. computer science, it illustrates the basic idea; the ontology defines some basic premises (concepts and relations between them) from which it is possible reason to gain new knowledge.

For a more elaborated and modern definition of the ontology we refer the reader to the one provided by Tom Gruber (2009). Another useful introduction to ontologies is the paper Ontology Development 101: A Guide to Creating Your First Ontology by Noy and McGuinness (2001), which is based on the Protege sortware, with which EMMO has been developed.

A taxonomy is a hierarchical representation of classes and subclasses connected via `is_a` relations. Hence, it is a subset of the ontology excluding all but the `is_a` relations. The main use of taxonomies is for the organisation of classifications. The figure shows a simple example of a taxonomy illustrating a categorisation of four classes into a hierarchy of more higher of levels of generality.

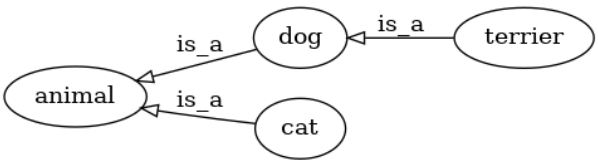

Figure 1.3: Example of a taxonomy.

In EMMO, the taxonomy is a rooted directed acyclic graph (DAG). This is important since many classification methods relies on this property, see e.g. Valentini (2014) and Robison et al (2015). Note, that EMMO is a DAG does not prevent some classes from having more than one parent. A `Variable` is for instance both a `Mathematical` and a `Symbol`. See appendix for the full EMMO taxonomy.

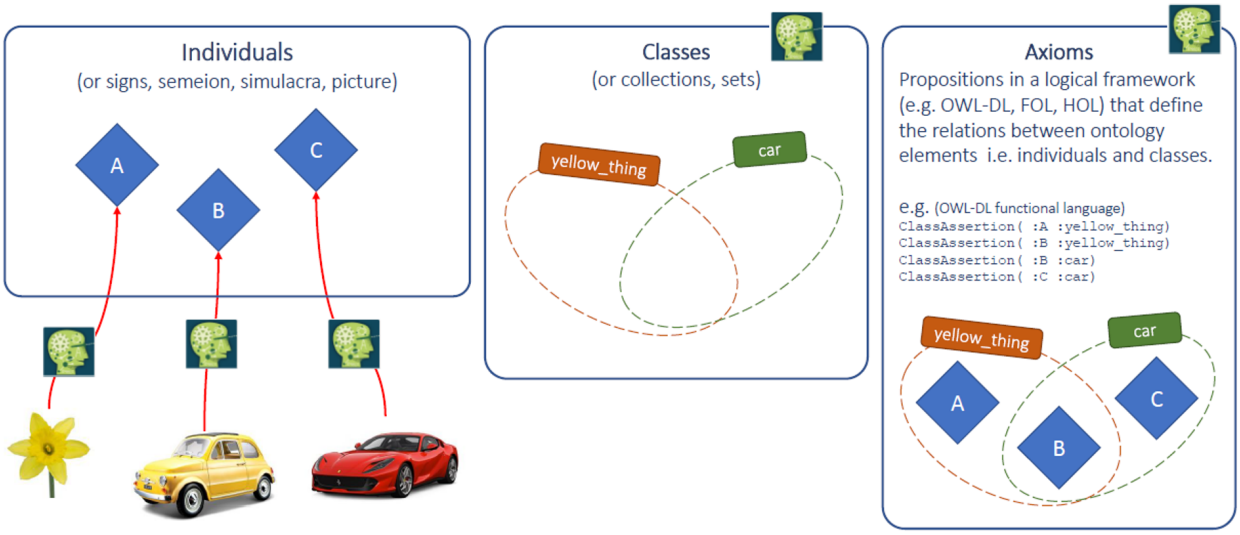

Figure 1.4: The primitive building blocks of EMMO.

Primitive elements in EMMO

Individuals

Individuals are the basic, "ground level" components of EMMO. They may include concrete objects such as cars, flowers, stars, persons and molecules, as well as abstract individuals such as a measured height, a specific equation and software programs.

Individuals possess attributes in form of axioms that are defined by the user (interpreter) upon declaration.

Classes

Classes represent concepts. They are the building blocks that we use to create an ontology as a representation of knowledge. We distinguish between *defined* and *non-defined* classes.

Defined classes are defined by the requirements for being a member of the class. In the graphical representations of EMMO, defined classes are orange. For instance, in the graph of the top-level entity branch below, The root `EMMO` and a defined class (defined to be the disjoint union of `Item` and `Collection`).

Non-defined classes are defined as an abstract group of objects, whose members are defined as belonging to the class. They are yellow in the graphical representations.

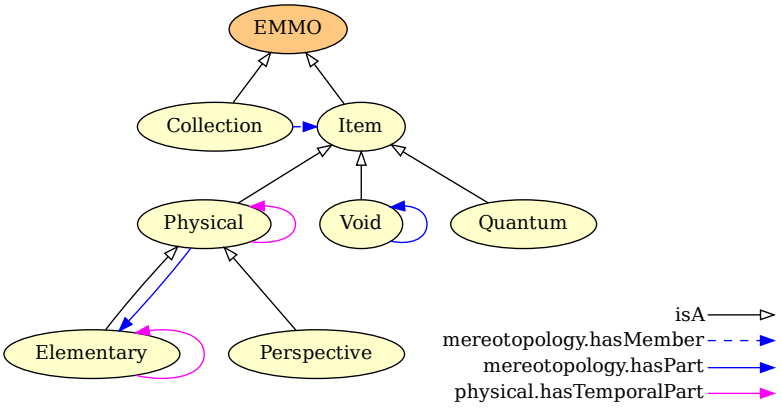

Figure 1.5: Example of the top-level branch of EMMO showing some classes and relationships between them.

Axioms

Axioms are propositions in a logical framework that define the relations between the individuals and classes. They are used to categorise individuals in classes and to define the *defined* classes.

The simplest form of a class axiom is a class description that just states the existence of the class and gives it an unique identifier. In order to provide more knowledge about the class, class axioms typically contain additional components that state necessary and/or sufficient characteristics of the class. OWL contains three language constructs for combining class descriptions into class axioms:

- *Subclass* (`rdfs:subClassOf`) allows one to say that the class extension of a class description is a subset of the class extension of another class description.
- *Equivalence* (`owl:equivalentClass`) allows one to say that a class description has exactly the same class extension (i.e. the individuals associated with the class) as another class description.
- *Distjointness* (`owl:disjointWith`) allows one to say that the class extension of a class description has no members in common with the class extension of another class description.

See the section about Description logic for more information about these language constructs. Axioms are also used to define relations between relations. These are further detailed in the chapter on Relations.

Theoretical foundations

EMMO build upon several theoretical frameworks.

Semiotics

Semiotics is the study of meaning-making. It is the dicipline of formulating something that possibly can exist in a defined space and time in the real world.

Mereotopology

Mereotopology is the combination of **mereology** (science of parthood) and **topology** (mathematical study of the geometrical properties and conservation through deformations). It is introdused via the `Item` class and based on the `mereotopological` relations. Items in EMMO are always topologically connected in space and time. EMMO makes a strong distinction between membership and parthood relations. In contrast to collections, items can only have parts that are themselves items. For further information, see Casati and Varzi "Parts and Places" (1999).

Physics

EMMO is strongly based on physics, with the aim of being able to describe all aspects and all domains of physics, from quantum mechanics to continuum, engeneering, chemistry, etc. EMMO is compatible with both the De Broglie - Bohm and the Copenhagen interpretation of quantum mecanics (see `Physical` for more comments).

EMMO defines a physics-based parthood hierachy under `Physical` by introducing the following concepts (illustrated in the figure below):

- `Elementary` is the fundamental, non-divisible constituent of entities. In EMMO, elementaries are based on the standard model of physics.
- `State` is a `Physical` whose parts does not change during its life time (at the chosen level of granularity). This is consistent with a state within e.g. thermodynamics.
- `Existent` is a succession of states.

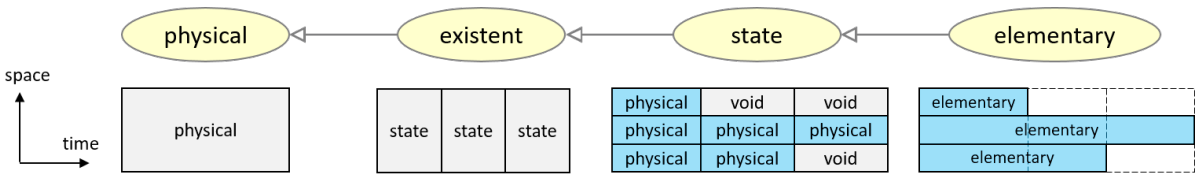

Figure 1.6: Parthood hierachy under `Physical`.

Metrology

Metrology is the science of measurements. It introduces units and links them to properties. The description of metrology in EMMO is based on the standards of International System of Quantities (ISQ) and International System of Units (SI).

Description logic

Description logic (DL) is a formal knowledge representation language in which the *axioms* are expressed. It is less expressive than first-order logic (FOL), but commonly used for providing the logical formalism for ontologies and semantic web. EMMO is expressed in the Web Ontology Language (OWL), which in turn is based on DL. This brings along features like reasoning.

Since it is essential to have a basic notion of OWL and DL, we include here a very brief overview. For a proper introduction to OWL and DL, we refer the reader to sources like Grau et.al. (2008), OWL2 Primer and OWL Reference.

OWL distinguishes between six types of class descriptions:

1. a class identifier (a IRI reference)
2. an exhaustive enumeration of individuals that together form the instances of a class (`owl:oneOf`)
3. a property restriction (`owl:someValuesFrom`, `owl:allValuesFrom`, `owl:hasValue`, `owl:cardinality`, `owl:minCardinality`, `owl:maxCardinality`)
4. the intersection of two or more class descriptions (`owl:intersectionOf`)
5. the union of two or more class descriptions (`owl:unionOf`)
6. the complement of a class description (`owl:complementOf`)

Except for the first, all of these refer to *defined classes*. The table below shows the notation in OWL, DL and the Manchester OWL syntax, all commonly used for the definitions. The Manchester syntax is used by Protege and is designed to not use DL symbols and to be easy and quick to read and write. Several other syntaxes exist for DL. An interesting example is the pure Python syntax proposed by Lamy (2017), which is used in the open source Owlready2 Python package. The Python API for EMMO is also based on Owlready2.

Table 1.1: Notation for DL and Protege. A and B are classes, R is an active relation, S is an passive relation, a and b are individuals and n is a literal. Inspired by the Great table of Description Logics.

DL	Manchester	Python + Owlready2	Read	Meaning
Constants				
$\top$		Thing	top	A special class with every individual as an instance
$\bot$		Nothing	bottom	The empty class
Axioms				
$A \doteq B$			A is defined to be equal to B	Class *definition*
$A \sqsubseteq B$	A subclass_of B	class A(B): …	all A are B	Class *inclusion*
		issubclass(A, B)		Test for *inclusion*
$A \equiv B$	A equivalent_to B	A.equivalent_to.append(B)	A is equivalent to B	Class *equivalence*
		B in A.equivalent_to		Test for equivalence
$a : A$	a is_a A	a = A()	a is a A	Class *assertion* (*instantiation*)
		isinstance(a, A)		Test for instance of
$(a, b) : R$	a object property assertion b	a.R.append(b)	a is R-related to b	Property *assertion*
$(a, n) : R$	a data property assertion n	a.R.append(n)	a is R-related to n	Data *assertion*
Constructions				

DL	Manchester	Python + Owlready2	Read	Meaning
$A \sqcap B$	A and B	A & B	A and B	Class *intersection* (*conjunction*)
$A \sqcup B$	A or B	A | B	A or B	Class *union* (*disjunction*)
$\neg A$	not A	Not(A)	not A	Class *complement* (*negation*)
$\{a, b, ...\}$	{a, b, ...}	OneOf([a, b, ...])	one of a, b, ...	Class *enumeration*
$S \equiv R^-$	S inverse_of R	Inverse(R) S.inverse == R	S is inverse of R	Property *inverse* Test for *inverse*
$\forall R.A$	R only A	R.only(A)	all A with R	*Universal restriction*
$\exists R.A$	R some A	R.some(A)	some A with R	*Existential restriction*
$= nR.A$	R exactly n A	R.exactly(n, A)		*Cardinality restriction*
$\leq nR.A$	R min n A	R.min(n, A)		*Minimum cardinality restriction*
$\geq nR.A$	R max n A	R.max(n, A)		*Minimum cardinality restriction*
$\exists R\{a\}$	R value a	R.value(a)		*Value restriction*
Decompositions				
$A \sqcup B \sqsubseteq \bot$	A disjoint with B	AllDisjoint([A, B])	A disjoint with B	Disjoint
		B in A.disjoints()		Test for disjointness
$\exists R.\top \sqsubseteq A$	R domain A	R.domain = [A]		Classes that the restriction applies to
$\top \sqsubseteq \forall R.B$	R range B	R.range = [B]		All classes that can be the value of the restriction

Examples

Here are some examples of different class descriptions using both the DL and Manchester notation.

Equivalence (`owl:equivalentTo`)

Equivalence ($\equiv$) defines necessary and sufficient conditions.

Parent is equivalent to mother or father

DL: `parent` $\equiv$ `mother` $\vee$ `father`

Manchester: `parent equivalent_to mother or father`

Inclusion (`rdf:subclassOf`)

Inclusion ($\sqsubseteq$) defines necessary conditions.

An employee is a person.

DL: `employee` $\sqsubseteq$ `person`

Manchester: `employee is_a person`

Enumeration (`owl:oneOf`)

The color of a wine is either white, rose or red:

DL: `wine_color` $\equiv$ {`white`, `rose`, `red`}

Manchester: `wine_color equivalent_to {white, rose, red}`

Existential restriction (`owl:someValuesFrom`)

A mother is a woman that has a child (some person):

DL: `mother` $\equiv$ `woman` $\sqcap \exists$`has_child`.`person`

Manchester: `mother equivalent_to woman and has_child some person`

Universal restriction (`owl:allValuesFrom`)

All parents that only have daughters:

DL: `parents_with_only_daughters` $\equiv$ `person` $\sqcap \forall$`has_child`.`woman`

Manchester: `parents_with_only_daughters equivalent_to person and has_child only woman`

Value restriction (`owl:hasValue`)

The owl:hasValue restriction allows to define classes based on the existence of particular property values. There must be at least one matching property value.

All children of Mary:

DL: `Marys_children` $\equiv$ `person` $\sqcap \exists$`has_parent`.{`Mary`}

Manchester: `Marys_children equivalent_to person and has_parent value Mary`

Property cardinality (`owl:cardinality`)

The owl:cardinality restrictions ($\geq$, $\leq$ or $\equiv$) allow to define classes based on the maximum (owl:maxCardinality), minimum (owl:minCardinality) or exact (owl:cardinality) number of occurences.

A person with one parent:

DL: `half_orphant` $\equiv$ `person` and $=1$`has_parent`.`person`

Manchester: `half_orphant equivalent_to person and has_parent exactly 1 person`

Intersection (`owl:intersectionOf`)

Individuals of the intersection ($\sqcap$) of two classes, are simultaneously instances of both classes.

A man is a person that is male:

DL: `man` $\equiv$ `person` $\sqcap$ `male`

Manchester: `man equivalent_to person and male`

Union (`owl:unionOf`)

Individuals of the union ($\sqcup$) of two classes, are either instances of one or both classes.

A person is a man or woman:

DL: `person` $\equiv$ `man` $\sqcup$ `woman`

Manchester: `person equivalent_to man or woman`

Complement (`owl:complementOf`)

Individuals of the complement ($\neg$) of a class, are all individuals that are not member of the class.

Not a man:

DL: `female` $\equiv \neg$ `male`

Manchester: `female equivalent_to not male`

The structure of EMMO

The EMMO ontology is structured in shells, expressed by specific ontology fragments, that extends from fundamental concepts to the application domains, following the dependency flow.

Top Level

The EMMO top level is the group of fundamental axioms that constitute the philosophical foundation of the EMMO. Adopting a physicalistic/nominalistic perspective, the EMMO defines real world objects as 4D objects that are always extended in space and time (i.e. real world objects cannot be spaceless nor timeless). For this reason abstract objects, i.e. objects that does not extend in space and time, are forbidden in the EMMO.

EMMO is strongly based on the analytical philosophy dicipline semiotic. The role of abstract objects are in EMMO fulfilled by semiotic objects, i.e. real world objects (e.g. symbol or sign) that stand for other real world objects that are to be interpreted by an agent. These symbols appear in actions (semiotic processes) meant to communicate meaning by establishing relationships between symbols (signs).

Another important building block of from analytical philosophy is atomistic mereology applied to 4D objects. The EMMO calls it 'quantum mereology', since the there is a epistemological limit to how fine we can resolve space and time due to the uncertainty principles.

The mereotopology module introduces the fundamental mereotopological concepts and their relations with the real world objects that they represent. The EMMO uses mereotopology as the ground for all the subsequent ontology modules. The concept of topological connection is used to define the first distinction between ontology entities namely the *Item* and *Collection* classes. Items are causally self-connected objects, while collections are causally disconnected. Quantum mereology is represented by the *Quantum* class. This module introduces also the fundamental mereotopological relations used to distinguish between space and time dimensions.

The physical module, defines the *Physical* objects and the concept of *Void* that plays a fundamental role in the description of multiscale objects and quantum systems. It also define the *Elementary* class, that restricts mereological atomism in space.

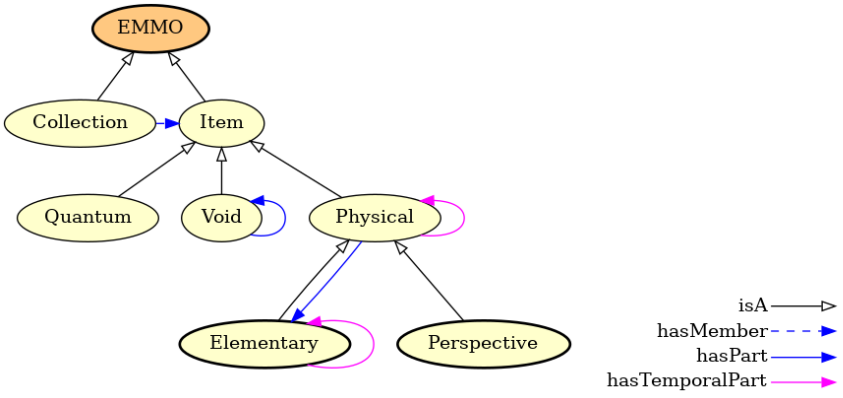

Figure 1.7: The EMMO top level.

In EMMO, the only univocally defined real world object is the *Item* individual called **Universe** that stands for the universe. Every other real world object is a composition of elementaries up to the most comprehensive object; the **Universe**. Intermediate objects are not univocally defined, but their definition is provided according to some specific philosophical perspectives. This is an expression of reductionism (i.e. objects are made of sub-objects) and epistemological pluralism (i.e. objects are always defined according to the perspective of an interpreter, or a class of interpreters).

The *Perspective* class collects the different ways to represent the objects that populate the conceptual region between the elementary and universe levels.

Middle Level

The middle level ontologies act as roots for extending the EMMO towards specific application domains.

The *Reductionistic* perspective class uses the fundamental non-transitive parthood relation, called direct parthood, to provide a powerful granularity description of multiscale real world objects. The EMMO can in principle represents the **Universe** with direct parthood relations as a direct rooted tree up to its elementary constituents.

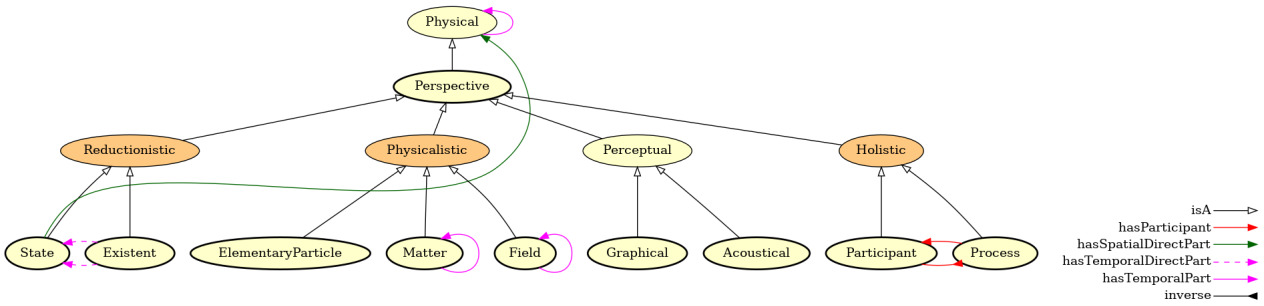

Figure 1.8: The EMMO perspectives.

The *Phenomenic* perspective class introduces the concept of real world objects that express of a recognisable pattern in space or time that impress the user. Under this class the EMMO categorises e.g. formal languages, pictures, geometry, mathematics and sounds. Phenomenic objects can be used in a semiotic process as signs.

The *Physicalistic* perspective class introduces the concept of real world objects that have a meaning for the under applied physics perspective.

The *Holistic* perspective class introduces the concept of real world objects that unfold in time in a way that has a meaning for the EMMO user, through the definition of the classes *Process* and *Participant*. The semiotics module introduces the concepts of semiotics and the *Semiosis* process that has a *Sign*, an *Object* and an *Interpreter* as participants. This forms the basis in EMMO to represent e.g. models, formal languages, theories, information and properties.

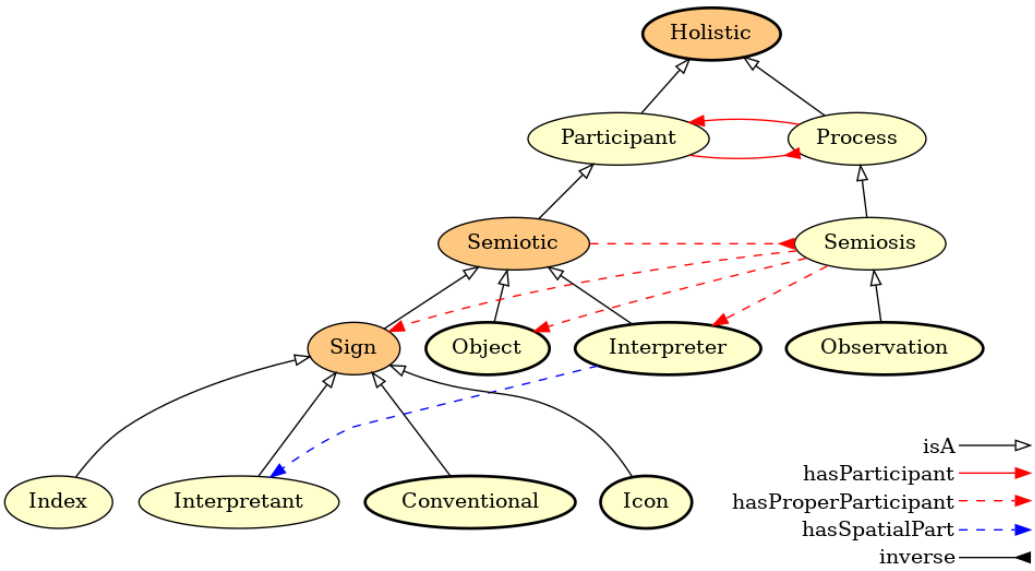

Figure 1.9: The semiotic level, showing both the taxonomy (open black arrows) and other relations as listed in the caption. The inverted arrows corresponds to inverse relations.

EMMO relations

All EMMO relations are subrelations of the relations found in the two roots: *mereotopological* and *semiotical*. The relation hierarchy extends more vertically (i.e. more subrelations) than horizontally (i.e. less sibling relations), facilitating the categorisation and inferencing of individuals. See also the chapter EMMO Relations.

Imposing all relations to fall under mereotopology or semiotics is how the EMMO force the developers to respect its perspectives. Two entities are related only by contact or parthood (mereotopology) or by standing one for another (semiosis): no other types of relation are possible within the EMMO.

A unique feature in EMMO, is the introduction of *direct parthood*. As illustrated in the figure below, it is a mereological relation that lacks transitivity. This makes it possible to entities made of parts at different levels of granularity and to go between granularity levels in a well-defined manner. This is paramount for cross scale

interoperability. Every material in EMMO is placed on a granularity level and the ontology gives information about the direct upper and direct lower level classes using the non-transitive direct parthood relations.

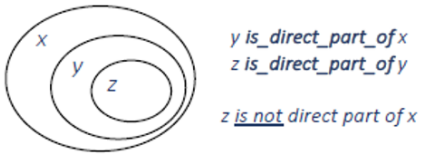

Figure 1.10: Direct parthood.

Annotations

All entities and relations in EMMO have some attributes, called *annotations*. In some cases, only the required *International Resource Identifier* (IRI) and *relations* are provided. However, descriptive annotations, like *elucidation* and *comment*, are planned to be added for all classes and relations. Possible annotations are:

- **Elucidation** is a human readable explanation and clearification of the documented class or relation.
- **Example** clearifies the elucidation through an example. A class may have several examples, each addressing different aspects.
- **Comment** is a clearifying note complementing the definition and elucidation. A class may have several comments, each clearifying different aspects.
- **IRI** stands for *international resource identifier*. It is an identifier that uniquely identifies the class or relation. IRIs are similar to URIs, but are not restricted to the ASCII character set. In EMMO, the IRIs are now valid URLs pointing to the stable version of EMMO.
- **Relations** is a list of relations applying to the current class or relation. The relations for relations are special and will be elaborated on in the introduction to chapter [Relations]. Some of the listed relations are defined in the OWL sources, while other are inferred by the reasoner. The relations are expressed using the Manchester OWL syntax introduced in section Description logic.

Chapter 2

EMMO Relations

In the language of OWL, relations are called *properties*. However, since relations describe relations between classes and individuals and since properties has an other meaning in EMMO, we only call them *relations*.

Resource Description Framework (RDF) is a W3C standard that is widely used for describing informations on the web and is one of the standards that OWL builds on. RDF expresses information in form of *subject-predicate-object* triplets. The subject and object are resources (aka items to describe) and the predicate expresses a relationship between the subject and the object.

In OWL are the subject and object classes or individuals (or data) while the predicate is a relation. An example of an relationship is the statement *dog is_a animal*. Here `dog` is the subject, `is_a` the predicate and `animal` the object.

OWL distingues between *object properties*, that link classes or individuals to classes or individuals, and *data properties* that link individuals to data values. Since EMMO only deals with classes, we will only be discussing object properties. However, in actual simulation or characterisation applications build on EMMO, datatype propertyes will be important.

The characteristics of the different properties are described by the following *property axioms*:

- `rdf:subPropertyOf` is used to define that a property is a subproperty of some other property. For instance, in the figure below showing the relation branch, we see that `active_relation` is a subproperty or `relation`. The `rdf:subPropertyOf` axioms forms a taxonomy-like tree for relations.
- `owl:equivalentProperty` states that two properties have the same property extension.
- `owl:inverseOf` axioms relate active relations to their corresponding passive relations, and vice versa. The root relation `relation` is its own inverse.
- `owl:FunctionalProperty` is a property that can have only one (unique) value y for each instance x, i.e. there cannot be two distinct values y1 and y2 such that the pairs (x,y1) and (x,y2) are both instances of this property. Both object properties and datatype properties can be declared as "functional".
- `owl:InverseFunctionalProperty`
- `owl:TransitiveProperty` states that if a pair (x,y) is an instance of P, and the pair (y,z) is instance of P, then we can infer that the pair (x,z) is also an instance of P.
- `owl:SymmetricProperty` states that if the pair (x,y) is an instance of P, then the pair (y,x) is also an instance of P. A popular example of a symmetric property is the `siblingOf` relation.
- `rdfs:domain` specifies which classes the property applies to. Or said differently, the valid values of the *subject* in a *subject-predicate-object* triplet.
- `rdfs:range` specifies the property extension, i.e. the valid values of the *object* in a *subject-predicate-object* triplet.

Root of EMMO relations

EMMORelation

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_ec2472ae_cf4a_46a5_8555_1556f5a6c3c5

Mereotopological branch

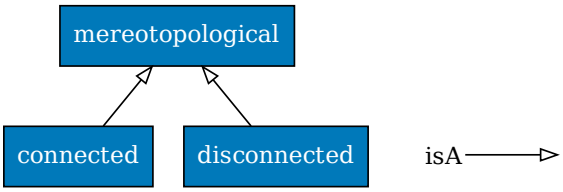

Figure 2.2: Mereotopological branch.

mereotopological

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_03212fd7_abfd_4828_9c8e_62c293052d4b

Comment: Mereotopology merges mereological and topological concepts and provides relations between wholes, parts, boundaries, etc.

Relations:

- is_a owl:ObjectProperty
- is_a owl:SymmetricProperty
- is_a owl:TransitiveProperty
- is_a mereotopology.EMMORelation
- Inverse(mereotopology.EMMORelation)
- equivalent_to Inverse(mereotopology.mereotopological)
- inverse_of mereotopology.mereotopological

disconnected

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_517dfaf9_4970_41ac_81ee_d031627d2c7c

Relations:

- is_a owl:ObjectProperty
- is_a owl:SymmetricProperty
- is_a mereotopology.mereotopological
- Inverse(mereotopology.mereotopological)
- equivalent_to Inverse(mereotopology.disconnected)
- inverse_of mereotopology.disconnected

Connected branch

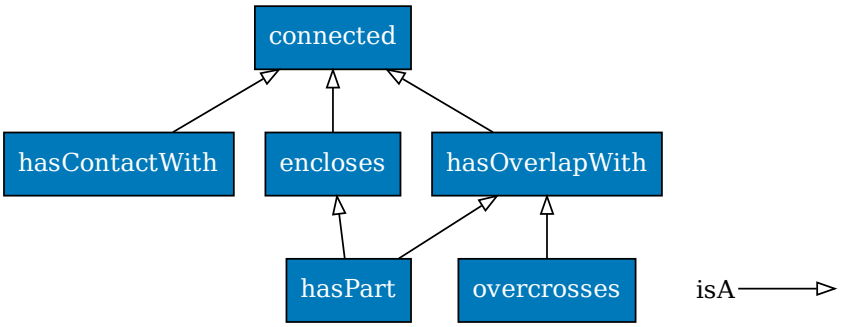

Figure 2.3: Connected branch.

encloses

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_8c898653_1118_4682_9bbf_6cc334d16a99

Comment: Enclosure is reflexive and transitive.

Relations:

- is_a owl:ObjectProperty
- is_a owl:TransitiveProperty
- is_a mereotopology.connected
- Inverse(mereotopology.connected)

hasContactWith

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_4d6504f1_c470_4ce9_b941_bbbebc9ab05d

Relations:

- is_a owl:ObjectProperty
- is_a owl:SymmetricProperty
- is_a mereotopology.connected
- Inverse(mereotopology.connected)
- equivalent_to Inverse(mereotopology.hasContactWith)
- inverse_of mereotopology.hasContactWith

hasOverlapWith

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_d893d373_b579_4867_841e_1c2b31a8d2c6

Relations:

- is_a owl:ObjectProperty
- is_a owl:SymmetricProperty
- is_a mereotopology.connected
- Inverse(mereotopology.connected)
- equivalent_to Inverse(mereotopology.hasOverlapWith)

- inverse_of mereotopology.hasOverlapWith

connected

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_6703954e_34c4_4a15_a9e7_f313760ae1a8

Comment: Causality is a topological property between connected items.

Comment: Items being connected means that there is a topological contact or “interaction” between them.

Relations:

- is_a owl:ObjectProperty
- is_a owl:SymmetricProperty
- is_a mereotopology.mereotopological
- Inverse(mereotopology.mereotopological)
- equivalent_to Inverse(mereotopology.connected)
- inverse_of mereotopology.connected

overcrosses

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_9cb984ca_48ad_4864_b09e_50d3fff19420

Relations:

- is_a owl:ObjectProperty
- is_a owl:SymmetricProperty
- is_a mereotopology.hasOverlapWith
- Inverse(mereotopology.hasOverlapWith)
- equivalent_to Inverse(mereotopology.overcrosses)
- inverse_of mereotopology.overcrosses

Has Part branch

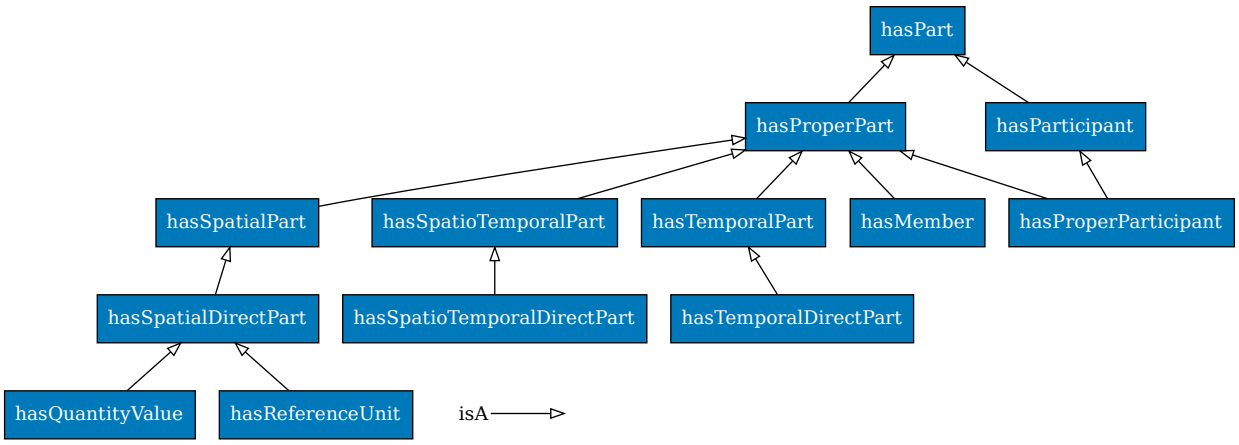

Figure 2.4: Has Part branch.

hasQuantityValue

IRI: http://emmo.info/emmo/middle/metrology#EMMO_8ef3cd6d_ae58_4a8d_9fc0_ad8f49015cd0

Comment: Relates a quantity to its reference unit through spatial direct parthood.

Relations:

- is_a owl:ObjectProperty
- is_a owl:InverseFunctionalProperty

- is_a owl:AsymmetricProperty
- is_a owl:IrreflexiveProperty
- is_a reductionistic.hasSpatialDirectPart
- domain metrology.Quantity
- range math.Numerical

hasProperParticipant

IRI: http://emmo.info/emmo/middle/holistic#EMMO_c5aae418_1622_4d02_93c5_21159e28e6c1

Relations:

- is_a owl:ObjectProperty
- is_a holistic.hasParticipant
- is_a mereotopology.hasProperPart

hasParticipant

IRI: http://emmo.info/emmo/middle/holistic#EMMO_ae2d1a96_bfa1_409a_a7d2_03d69e8a125a

Comment: Participation is a parthood relation: you must be part (and then be connected) of the process to contribute to it.

Comment: Participation is not under direct parthood since a process is not strictly related to reductionism, but it's a way to categorize temporal regions by the interpreters.

Relations:

- is_a owl:ObjectProperty
- is_a mereotopology.hasPart
- domain holistic.Process

hasReferenceUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_67fc0a36_8dcb_4ffa_9a43_31074efa3296

Comment: Relates the physical quantity to its unit through spatial direct parthood.

Versioninfo: In EMMO version 1.0.0-beta, physical quantities used the hasReferenceUnit object property to relate them to their units via physical dimensionality. This was simplified in 1.0.0-alpha3 in order to make reasoning faster.

The restriction (e.g. for the physical quantity Length)

```
Length hasReferenceUnit only (hasPhysicsDimension only LengthDimension)
```

was in 1.0.0-alpha3 changed to

```
Length hasPhysicsDimension some LengthDimension
```

Likewise were the universal restrictions on the corresponding unit changed to excistential. E.g.

```
Metre hasPhysicsDimension only LengthDimension
```

was changed to

```
Metre hasPhysicsDimension some LengthDimension
```

The label of this class was also changed from PhysicsDimension to PhysicalDimension.

Chapter 3

EMMO Classes

emmo is a class representing the collection of all the individuals (signs) that are used in the ontology. Individuals are declared by the EMMO users when they want to apply the EMMO to represent the world.

EMMO branch

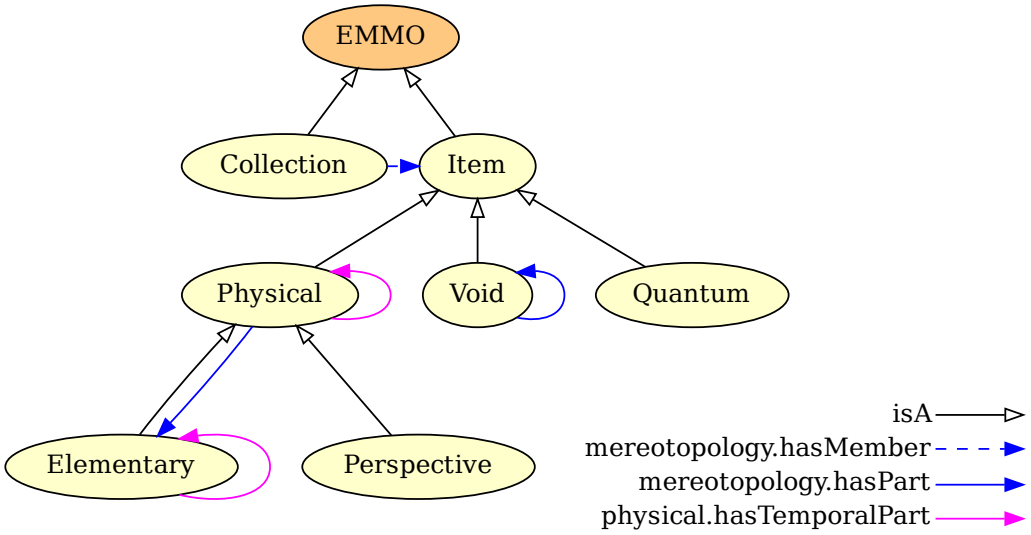

Figure 3.1: EMMO branch.

The root of all classes used to represent the world. It has two children; *collection* and *item*.

collection is the class representing the collection of all the individuals (signs) that represents a collection of non-connected real world objects.

item Is the class that collects all the individuals that are members of a set (it's the most comprehensive set individual). It is the branch of mereotopology.

Collection

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_2d2ecd97_067f_4d0e_950c_d746b7700a31

Elucidation: The class of all individuals that stand for a real world not self-connected object.

Comment: A 'Collection' individual stands for a non-self-connected real world object.

A ‘Collection’ individual is related to each ‘Item’ individuals of the collection (i.e. the members) through the membership relation.

An ‘Item’ individual stands for a real world self-connected object which can be represented as a whole made of connected parts (e.g. a car made of components).

Comment: Formally, ‘Collection’ is axiomatized as the class of individuals that hasMember some ‘Item’.

A ‘Collection’ cannot have as member another ‘Collection’.

Comment: From Latin collectio, from colligere ‘gather together’.

Comment: e.g. the collection of users of a particular software, the collection of atoms that have been part of that just dissociated molecule, or even the collection of atoms that are part of a molecule considered as single individual non-connected objects and not as a mereotopological self-connected fusion.

Relations:

- is_a mereotopology.EMMO
- mereotopology.hasMember some mereotopology.Item

EMMO

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_802d3e92_8770_4f98_a289_ccaaab7fdddf

Elucidation: The class representing the collection of all the individuals declared in this ontology standing for real world objects.

Comment: ‘EMMO’ is the disjoint union of ‘Item’ and ‘Collection’ (covering axiom).

The union implies that ‘EMMO’ individuals can only be ‘Item’ individuals (standing for self-connected real world objects) or ‘Collection’ individuals (standing for a collection of disconnected items).

Disjointness means that a ‘Collection’ individual cannot be an ‘Item’ individual and viceversa, representing the fact that a real world object cannot be self-connected and non-self connected at the same time.

Comment: For the EMMO ontologist the whole universe is represented as a 4D path-connected topological manifold (i.e. the spacetime).

A real world object is then a 4D topological sub-region of the universe.

A universe sub-region is isolated and defined as a real world object by the ontologist. Then, through a semiotic process that occurs at meta-ontological level (i.e. outside the ontology). an EMMO ontology entity (e.g. an OWL individual) is assigned to represent that real world object.

The fundamental distinction between real world objects, upon which the EMMO is based, is self-connectedness: a real world object can be self-connected xor not self-connected.

Comment: In the EMMO we will refer to the universe as a Minkowski space, restricting the ontology to special relativity only. However, exension to general relativity, will adding more complexity, should not change the overall approach.

Comment: Mereotopology is the fundamental logical representation used by the EMMO ontologist to characterize the universe and to provide the definitions to connect real world objects to the EMMO concepts.

Parthood relations do not change dimensionality of the real world object referred by an ‘EMMO’ individual, i.e. every part of a real world object always retains its 4D dimensionality.

The smallest part of a real world object (i.e. a part that has no proper parts) is referred in the EMMO by a ‘Quantum’ individual.

It follows that, for the EMMO, real world objects of dimensionality lower than 4D (e.g. surfaces, lines) do not exist.

Relations:

- is_a owl:Thing
- equivalent_to mereotopology.hasPart some mereotopology.Quantum
- equivalent_to Inverse(mereotopology.hasPart) value mereotopology.Universe
- disjoint_union_of mereotopology.Collection, mereotopology.Item

Item

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_eb3a768e_d53e_4be9_a23b_0714833c36de

Comment: A real world object is self-connected if any two parts that make up the whole are connected to each other (here the concept of connection is primitive).

Alternatively, using the primitive path-connectivity concept we can define a self-connected real world object as an object for which each couple of points is path-connected.

Comment: An 'Item' individual stands for a real world self-connected object which can be represented as a whole made of connected parts (e.g. a car made of components).

In the EMMO, connectivity is the topological foundation of causality.

All physical systems, i.e. systems whose behaviour is explained by physics laws, are represented only by 'Item'-s.

Members of a 'Collection' lack of causality connection, i.e. they do not constitute a physical system as a whole.

Comment: From Latin item, "likewise, just so, moreover".

Relations:

- is_a mereotopology.EMMO
- disjoint_union_of physical.Void, physical.Physical

Quantum

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_3f9ae00e_810c_4518_aec2_7200e424cf68

Elucidation: The class of 'EMMO' individuals that stand for real world objects that can't be further divided in time nor in space.

Example: For a physics based ontology the 'Quantum' can stand for the smallest identifiable portion of spacetime defined by the Planck limit in length (1.616e-35 m) and time (5.39e-44 s).

However, the quantum mereotopology approach is not restricted only to physics. For example, in a manpower management ontology, a 'Quantum' can stand for an hour (time) of a worker (space) activity.

Comment: A 'Quantum' is the most fundamental subclass of 'Item', since its individuals stand for the smallest possible self-connected 4D real world objects.

The quantum concept recalls the fact that there is lower epistemological limit to our knowledge of the universe, related to the uncertainity principle.

Comment: A 'Quantum' stands for a 4D real world object.

Comment: A quantum is the EMMO mereological 4D a-tomic entity.

To avoid confusion with the concept of atom coming from physics, we will use the expression quantum mereology, instead of a-tomistic mereology.

Comment: From Latin quantum (plural quanta) "as much as, so much as;", introduced in physics directly from Latin by Max Planck, 1900.

Relations:

- is_a mereotopology.Item
- is_a mereotopology.EMMO
- mereotopology.hasProperPart only owl:Nothing

Void

IRI: http://emmo.info/emmo/top/physical#EMMO_29072ec4_ffcb_42fb_bdc7_26f05a2e9873

Elucidation: A 'Item' that has no 'Physical' parts.

Comment: From Latin vacuus, "empty".

Comment: The void concept is paramount for the representation of physical systems according to quantum theory.

Relations:

- is_a mereotopology.Item
- mereotopology.hasPart only physical.Void

Physical

IRI: http://emmo.info/emmo/top/physical#EMMO_c5ddfdba_c074_4aa4_ad6b_1ac4942d300d

Elucidation: A 'Item' that has part some 'Elementary' and whose temporal proper parts are only 'Physical'-s (i.e. it can be perceived without interruptions in time).

Comment: A 'Physical' is the class that contains all the individuals that stand for real world objects that interact physically with the ontologist, i.e. physical objects.

A physical object must be perceived through physical interaction by the ontologist. Then the ontologist can declare an individual standing for the physical object just perceived.

Perception is a subcategory of physical interactions. It is an interaction that stimulate a representation of the physical object within the ontologist (the agent).

Comment: A 'Physical' must include at least an 'Elementary' part, and can include 'Void' parts.

A 'Physical' may include as part also the 'Void' surrounding or enclosed by its 'Physical' sub parts.

There are no particular criteria for 'Physical'-s structure, except that is made of some 'Elementary'-s as proper parts and not only 'Void'.

This is done in order to take into account the quantum nature of physical systems, in which the actual position of sub-components (e.g. electrons in an atom) is not known except for its probability distribution function (according to the Copenhagen interpretation.)

e.g. a real world object that has spatial parts an atom and a cubic light year of void, extending for some time, can be a physical object.

Comment: A 'Physical' with dimensions other than 4D cannot exist, following the restriction of the parent 'EMMO' class.

It follows from the fact that perception is always unfolding in time.

e.g. you always have an aperture time when you take a picture or measure a property. Instantaneous perceptions are idealizations (abstractions) or a very small time measurement.

Comment: From Latin physica "study of nature" (and Ancient Greek φυσικός, "natural").

Here the word relates to things perceived through the senses as opposed to the mind; tangible or concrete.

Comment: In the EMMO there are no relations such as occupiesSpace, since 'Physical'-s are themselves the 4D regions.

Comment: The EMMO can be used to represent real world entities as 'Physical'-s that are easy to connect to classical or quantum mechanical based models.

Classical mechanics poses no representational issues, for the EMMO: the 4D representation of 'Physical'-s is consistent with classical physics systems.

However, the representation of 'Physical'-s that are typically analized through quantum mechanics (e.g. molecules, atoms, clusters), is not straightforward.

1) De Broglie - Bohm interpretation The most simple approach is to rely on Bohmian mechanics, in which each particle is supposed to exists in a specific position between measurements (hidden variables approach), while its trajectory is calculated using a Guiding Equation based on a quantum field calculated with the Schroedinger Equation.

While this approach is really easy to implement in an ontology, since each entity has its own well defined 4D region, its mathematical representation failed to receive large consensus due to the difficulties to include relativistic effects, to be extended to subnuclear scale and the strong non-locality assumtpion of the quantum field.

Nevertheless, the Bohmian mechanics is a numerical approach that is used in electronic models to reduce the computational effort of the solution of Schroedinger Equation.

In practice, an EMMO user can declare a 'physical' individual that stand for the whole quantum system to be described, and at the same time all sub-parts individuals can be declared, having them a well defined position

in time, according to De Broglie - Bohm interpretation. The Hamiltonian can be calculated by considering the sub-part individuals.

'physical'-s are then made of 'physical' parts and 'void' parts that stand for the space between 'physical'-s (e.g. the void between electrons and nucleus in an atom).

2) Copenhagen interpretation In this interpretation the properties (e.g. energy level, position, spin) of a particle are not defined in the interval between two measurements and the quantum system is entangled (i.e. properties of particles in the sysyem are correlated) and described by a global wavefunction obtained solving the Schroedinger Equation.

Upon measurement, the wavefunction collapses to a combination of close eigenstates that provide information about bservables of the system components (e.g. position, energy).

The EMMO can be used to represent 'physical'-s that can be related to Copenhagen based models. In practice, the user should follow these steps:

a) define the quantum system as a 'physical' individual (e.g. an H2 molecule) under a specific class (e.g. 'h2_molecule'). This individual is the whole.

b) define the axioms of the class that describe how many sub-parts are expected for the whole and their class types (e.g. 'h2_molecule' has axioms 'has_proper_part exactly 2 electron' and 'has_proper_part exactly 2 nucleus)

c) the user can now connect the whole to a Schroedinger equation based model whose Hamiltonian is calculated trough the information coming only from the axioms. No individuals are declared for the subparts!

d) a measurement done on the quantum system that provides information on the sub-part observables is interpreted as wavefunction collapse and leads to the end of the whole and the declaration of the sub-parts individuals which can be themselves other quantum systems

e.g. if the outer electron of the H2 molecule interacts with another entity defining its state, then the whole that stands for the entangled H2 molecule becomes a 'physical' made of an electron individual, a quantum system made of one electron and two nuclei and the void between them.

e.g. in the Born-Oppenheimer approximation the user represent the atom by un-entangling nucleus and electronic cloud. The un-entanglement comes in the form of declaration of individual as parts.

e.g. the double slit experiment can be represent in the EMMO as: a) before the slit: a 'physical' that extend in space and has parts 'electron' and 'void', called 'single_electron_wave_function'. 'electron' and 'void' are only in the axioms and not decalred individuals. b) during slit passage: a 'physical' made of one declared individual, the 'electron'. c) after the slit: again 'single_electron_wave_function' d) upon collision with the detector: 'physical' made of one declared individual, the 'electron'.

Comment: The purpose of the 'Physical' branch is to provide a representation of the real world objects, while the models used to name, explain or predict the behaviour of the real world objects lay under the 'Semiotic' branch.

More than one semiotic representation can be connected to the same 'Physical'.

e.g. Navier-Stokes or Euler equation applied to the same fluid are an example of mathematical model used to represent a physical object for some specific interpreter.

Relations:

- is_a mereotopology.Item
- mereotopology.hasPart some physical.Elementary
- physical.hasTemporalPart only physical.Physical

Individuals:

- mereotopology.Universe

Elementary branch

Elementary

IRI: http://emmo.info/emmo/top/physical#EMMO_0f795e3e_c602_4577_9a43_d5a231aa1360

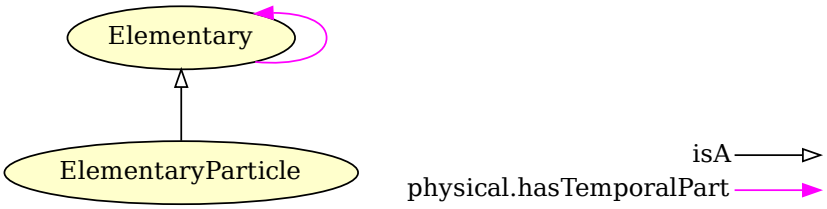

Figure 3.2: Elementary branch.

Elucidation: The basic constituent of 'item'-s that can be proper partitioned only in time up to quantum level.

Comment: According to mereology, this should be call 'a-tomistic' in the strict etimological sense of the word (from greek, a-tomos: un-divisible).

Mereology based on such items is called atomistic mereology.

However, in order not to confuse the lexicon between mereology and physics (in which an atom is a divisible physical entity) we prefer to call it 'elementary', recalling the concept of elementary particle coming from the standard particles model.

Comment: From Latin elementārius ("elementary"), from elementum ("one of the four elements of antiquity; fundamentals")

Comment: While a 'Quantum' is a-tomistic in time and space, an 'elementary' is a-tomistic only in space, recalling the concept of elementary particle.

Relations:

- is_a physical.Physical
- physical.hasTemporalPart only physical.Elementary
- physical.hasSpatialPart only owl:Nothing

Perspective branch

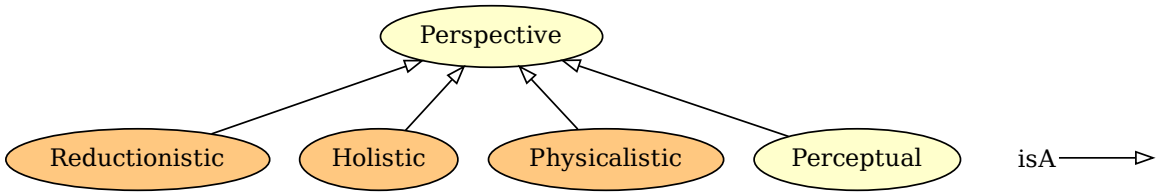

Figure 3.3: Perspective branch.

Perspective

IRI: http://emmo.info/emmo/top#EMMO_49267eba_5548_4163_8f36_518d65b583f9

Elucidation: The class of individuals that stand for real world objects according to a specific representational perspective.

Comment: This class is the practical implementation of the EMMO pluralistic approach for which the only objective categorization is provided by the Universe individual and all the Quantum individuals.

Between these two extremes, there are several subjective ways to categorize real world objects, each one provide under a 'Perspective' subclass.

Relations:

- is_a physical.Physical

Holistic branch

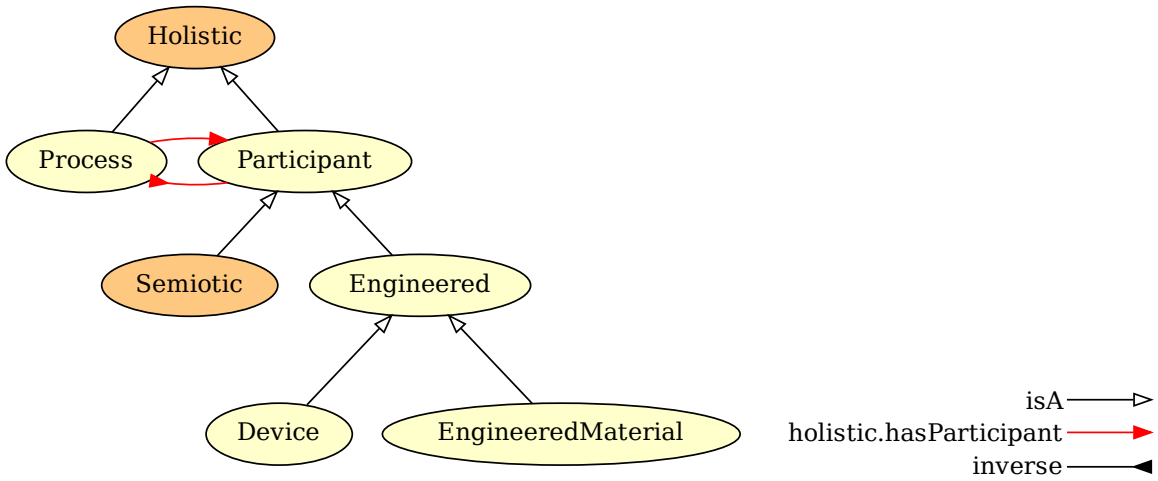

Figure 3.4: Holistic branch.

Participant

IRI: http://emmo.info/emmo/middle/holistic#EMMO_49804605_c0fe_4538_abda_f70ba1dc8a5d

Elucidation: A portion of a 'Process' that participates to the process with a specific role.

Comment: In the EMMO the relation of participation to a process falls under mereotopology.

Since topological connection means causality, then the only way for a real world object to participate to a process is to be a part of it.

Relations:

- is_a holistic.Holistic
- is_a physical.Physical
- Inverse(holistic.hasParticipant) some holistic.Process

Device

IRI: http://emmo.info/emmo/middle/manufacturing#EMMO_494b372c_cfdf_47d3_a4de_5e037c540de8

Elucidation: An engineered object which is instrumental for reaching a particular purpose through its characteristic functioning process, with particular reference to mechanical or electronic equipment.

Comment: From Old French "deviser", meaning: arrange, plan, contrive.

Literally "dispose in portions," from Vulgar Latin "divisare", frequentative of Latin dividere, meaning "to divide"

Relations:

- is_a manufacturing.Engineered
- Inverse(holistic.hasProperParticipant) some manufacturing.DiscreteManufacturing

EngineeredMaterial

IRI: http://emmo.info/emmo/middle/manufacturing#EMMO_ec7464a9_d99d_45f8_965b_4e9230ea8356

Comment: A material that is synthesized within a manufacturing process.

Relations:

- is_a manufacturing.Engineered
- is_a physicalistic.Material
- Inverse(holistic.hasProperParticipant) some manufacturing.ContinuumManufacturing

Engineered

IRI: http://emmo.info/emmo/middle/manufacturing#EMMO_86ca9b93_1183_4b65_81b8_c0fcd3bba5ad

Elucidation: A 'physical' that stands for a real world object that has been designed and manufactured for a particular purpose.

Example: Car, tire, composite material.

Comment: The 'Engineered' branch represents real world objects that show some level of complexity/heterogeneity in their composition, and are made for a specific use.

Relations:

- is_a holistic.Participant
- Inverse(holistic.hasProperParticipant) some manufacturing.Manufacturing

Holistic

IRI: http://emmo.info/emmo/middle/holistic#EMMO_0277f24a_ea7f_4917_81b7_fb0406c8fc62

Elucidation: A union of classes that categorize physicals under a holistic perspective: the interest is on the whole 4D object (process) and the role of its 4D parts (participants) without going further into specifying the spatial hierarchy or the temporal position of each part.

Comment: An holistic perspective considers each part of the whole as equally important, without the need of a granularity hierarchy (in time or space).

A molecule of a body can have role in the body evolution, without caring if its part of a specific organ and without specifying the time interval in which this role occurred.

This class allows the picking of parts without necessarily going trough a rigid hierarchy of spatial compositions (e.g. body → organ → cell → molecule) or temporal composition.

Comment: Holism (from Greek *ὅλος* holos "all, whole, entire")

Relations:

- is_a top.Perspective
- equivalent_to holistic.Process or holistic.Participant

Semiotic branch

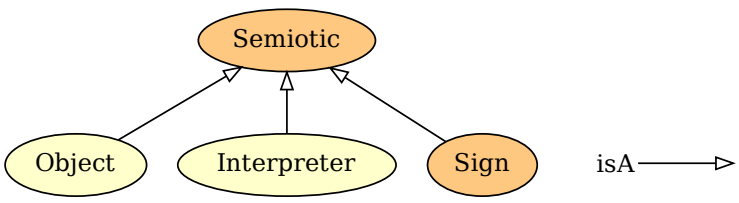

Figure 3.5: Semiotic branch.

Semiotic

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_b803f122_4acb_4064_9d71_c1e5fd091fc9

Elucidation: The class of individuals that stands for semiotic objects, i.e. objects that take part on a semiotic process.

Comment: Semiotic subclasse are defined using Peirce's semiotic theory.

"Namely, a sign is something, A, which brings something, B, its interpretant sign determined or created by it, into the same sort of correspondence with something, C, its object, as that in which itself stands to C." (Peirce 1902, NEM 4, 20–21).

The triadic elements: - 'sign': the sign A (e.g. a name) - 'interpretant': the sign B as the effects of the sign A on the interpreter (e.g. the mental concept of what a name means) - 'object': the object C (e.g. the entity to which the sign A and B refer to)

This class includes also the 'interpeter' i.e. the entity that connects the 'sign' to the 'object'

Relations:

- is_a holistic.Participant
- Inverse(holistic.hasProperParticipant) some semiotics.Semiosis
- equivalent_to semiotics.Interpreter or semiotics.Object or semiotics.Sign

Sign branch

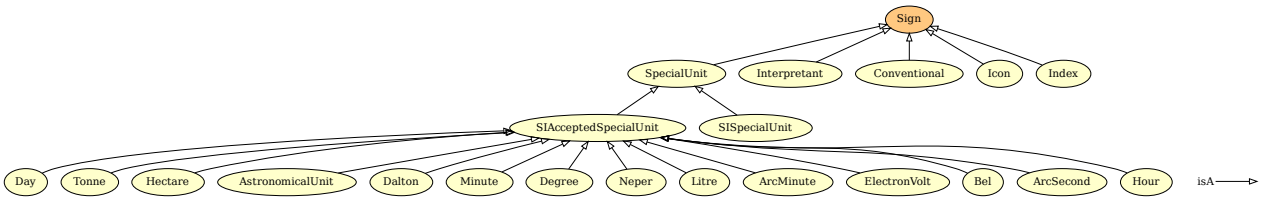

Figure 3.6: Sign branch.

Day

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_28ef05a7_ecc1_4df6_8116_c53251fbd4a8

Definition: A measure of time defined as 86 400 seconds.

Dbpediaentry: http://dbpedia.org/page/Day

Iupacentry: https://doi.org/10.1351/goldbook.D01527

Qudtentry: http://qudt.org/vocab/unit/DAY

SpecialUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_3ee80521_3c23_4dd1_935d_9d522614a3e2

Elucidation: A unit symbol that stands for a derived unit.

Example: Pa stands for N/m2 J stands for N m

Comment: Special units are semiotic shortcuts to more complex composed symbolic objects.

Relations:

- is_a metrology.DerivedUnit
- is_a metrology.UnitSymbol
- is_a semiotics.Sign
- Inverse(semiotics.hasSign) some metrology.DerivedUnit

Neper

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_b41515a9_28d8_4d78_8165_74b2fc72f89e

Definition: Unit of measurement for quantities of type level or level difference, which are defined as the natural logarithm of the ratio of power- or field-type quantities.

The value of a ratio in nepers is given by `ln(x1/x2)` where `x1` and `x2` are the values of interest (amplitudes), and ln is the natural logarithm. When the values are quadratic in the amplitude (e.g. power), they are first linearised by taking the square root before the logarithm is taken, or equivalently the result is halved.

Wikipedia

Dbpediaentry: http://dbpedia.org/page/Neper

Iupacentry: https://doi.org/10.1351/goldbook.N04106

Qudtentry: http://qudt.org/vocab/unit/NP

Interpretant

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_054af807_85cd_4a13_8eba_119dfdaaf38b

Elucidation: The interpreter’s internal representation of the object in a semiosis process.

Relations:

- is_a semiotics.Sign

Litre

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_a155dc93_d266_487e_b5e7_2a2c72d5ebf9

Definition: A non-SI unit of volume defined as 1 cubic decimetre (dm3),

Iupacentry: https://doi.org/10.1351/goldbook.L03594

Qudtentry: http://qudt.org/vocab/unit/L

Relations:

- is_a units-extension.SIAcceptedSpecialUnit
- is_a metrology.OffSystemUnit
- metrology.hasPhysicalDimension some isq.VolumeDimension
- perceptual.hasSymbolData value “l”

Sign

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_b21a56ed_f969_4612_a6ec_cb7766f7f31d

Elucidation: An ‘Physical’ that is used as sign (“semeion” in greek) that stands for another ‘Physical’ through an semiotic process.

Example: A novel is made of chapters, paragraphs, sentences, words and characters (in a direct parthood mereological hierarchy).

Each of them are ‘sign’-s.

A character can be the a-tomistic ‘sign’ for the class of texts.

The horizontal segment in the character “A” is direct part of “A” but it is not a ‘sign’ itself.

For plain text we can propose the ASCII symbols, for math the fundamental math symbols.

Comment: A ‘Sign’ can have temporal-direct-parts which are ‘Sign’ themselves.

A 'Sign' usually have 'sign' spatial direct parts only up to a certain elementary semiotic level, in which the part is only a 'Physical' and no more a 'Sign' (i.e. it stands for nothing). This elementary semiotic level is peculiar to each particular system of signs (e.g. text, painting).

Just like an 'Elementary' in the 'Physical' branch, each 'Sign' branch should have an a-tomistic mereological part.

Comment: According to Peirce, 'Sign' includes three subcategories: - symbols: that stand for an object through convention - indeces: that stand for an object due to causal continguity - icon: that stand for an object due to similitudes e.g. in shape or composition

Relations:

- is_a semiotics.Semiotic
- equivalent_to semiotics.Index or semiotics.Conventional or semiotics.Icon

Index

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_0cd58641_824c_4851_907f_f4c3be76630c

Elucidation: A 'Sign' that stands for an 'Object' due to causal continguity.

Example: Smoke stands for a combustion process (a fire). My facial expression stands for my emotional status.

Relations:

- is_a semiotics.Sign

ArcMinute

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_1e0b665d_db6c_4752_a6d4_262d3a8dbb46

Definition: Measure of plane angle defined as 1/60 or a degree.

Altlabel: MinuteOfArc

Qudtentry: http://qudt.org/vocab/unit/ARCMIN

Interpreter branch

MeasurementInstrument

IRI: http://emmo.info/emmo/middle/properties#EMMO_f2d5d3ad_2e00_417f_8849_686f3988d929

Relations:

- is_a properties.Observer

Observer

IRI: http://emmo.info/emmo/middle/properties#EMMO_1b52ee70_121e_4d8d_8419_3f97cd0bd89c

Elucidation: An ‘interpreter’ that perceives another ‘entity’ (the ‘object’) through a specific perception mechanism and produces a ‘property’ (the ‘sign’) that stands for the result of that particular perception.

Relations:

- is_a semiotics.Interpreter
- Inverse(holistic.hasParticipant) some properties.Observation

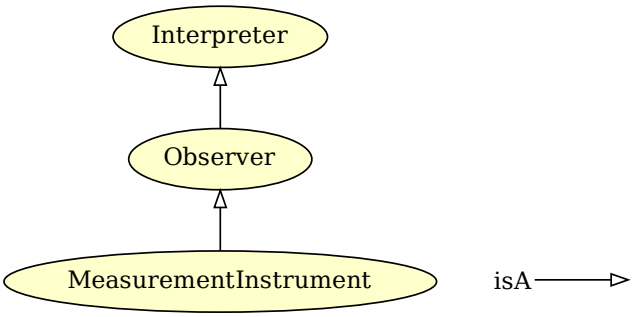

Figure 3.7: Interpreter branch.

Interpreter

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_0527413c_b286_4e9c_b2d0_03fb2a038dee

Elucidation: The entity (or agent, or observer, or cognitive entity) who connects 'Sign', 'Interpretant' and 'Object'.

Relations:

- is_a semiotics.Semiotic
- physical.hasSpatialPart some semiotics.Interpretant

Object branch

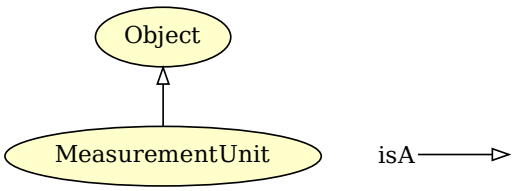

Figure 3.8: Object branch.

Object

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_6f5af708_f825_4feb_a0d1_a8d813d3022b

Elucidation: The object, in Peirce semiotics.

Comment: Here is assumed that the concept of 'object' is always relative to a 'semiotic' process. An 'object' does not exists per se, but it's always part of an interpretation.

The EMMO relies on strong reductionism, i.e. everything real is a formless collection of elementary particles: we give a meaning to real world entities only by giving them boundaries and defining them using 'sign'-s.

In this way the 'sign'-ed entity become and 'object', and the 'object' is the basic entity needed in order to apply a logical formalism to the real world entities (i.e. we can speak of it through its sign, and use logics on it through its sign).

Relations:

- is_a semiotics.Semiotic

Conventional branch

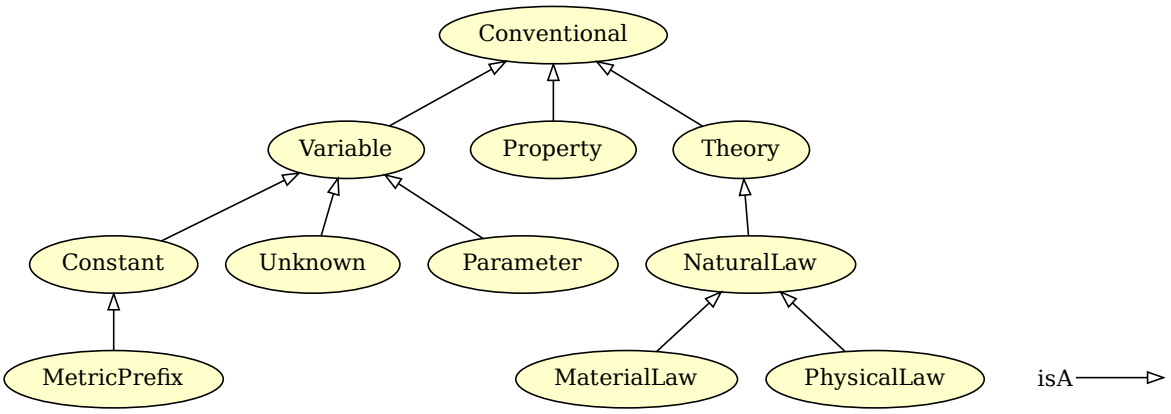

Figure 3.9: Conventional branch.

NaturalLaw

IRI: http://emmo.info/emmo/middle/models#EMMO_db9a009e_f097_43f5_9520_6cbc07e7610b

Relations:

- is_a models.Theory

Variable

IRI: http://emmo.info/emmo/middle/math#EMMO_1eed0732_e3f1_4b2c_a9c4_b4e75eeb5895

Elucidation: A 'Variable' is a symbolic object that stands for a numerical defined 'Mathematical' object like e.g. a number, a vector, a matrix.

Example: x k

Relations:

- is_a math.Mathematical
- is_a semiotics.Conventional
- Inverse(math.hasVariable) some math.Mathematical

Theory

IRI: http://emmo.info/emmo/middle/models#EMMO_8d2d9374_ef3a_47e6_8595_6bc208e07519

Elucidation: A 'conventional' that stand for a 'physical'.

Comment: The 'theory' is e.g. a proposition, a book or a paper whose sub-symbols suggest in the mind of the interpreter an interpretant structure that can represent a 'physical'.

It is not an 'icon' (like a math equation), because it has no common resemblance or logical structure with the 'physical'.

In Peirce semiotics: legisign-symbol-argument

Relations:

- is_a semiotics.Conventional

Constant

IRI: http://emmo.info/emmo/middle/math#EMMO_ae15fb4f_8e4d_41de_a0f9_3997f89ba6a2

Elucidation: A 'varaible' that stand for a well known constant.

Example: π refers to the constant number ~3.14

Relations:

- is_a math.Variable
- Inverse(math.hasVariable) only math.Numerical

Conventional

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_35d2e130_6e01_41ed_94f7_00b333d46cf9

Elucidation: A 'Sign' that stands for an 'Object' through convention, norm or habit, without any resemblance to it.

Comment: In Peirce semiotics this kind of sign category is called symbol. However, since symbol is also used in formal languages, the name is changed in conventional.

Relations:

- is_a semiotics.Sign

MaterialLaw

Parameter

IRI: http://emmo.info/emmo/middle/math#EMMO_d1d436e7_72fc_49cd_863b_7bfb4ba5276a

Example: viscosity in the Navier-Stokes equation

Comment: A 'variable' whose value is assumed to be known independently from the equation, but whose value is not explicitated in the equation.

Relations:

- is_a math.Variable

Property branch

QuantitativeProperty

IRI: http://emmo.info/emmo/middle/metrology#EMMO_dd4a7f3e_ef56_466c_ac1a_d2716b5f87ec

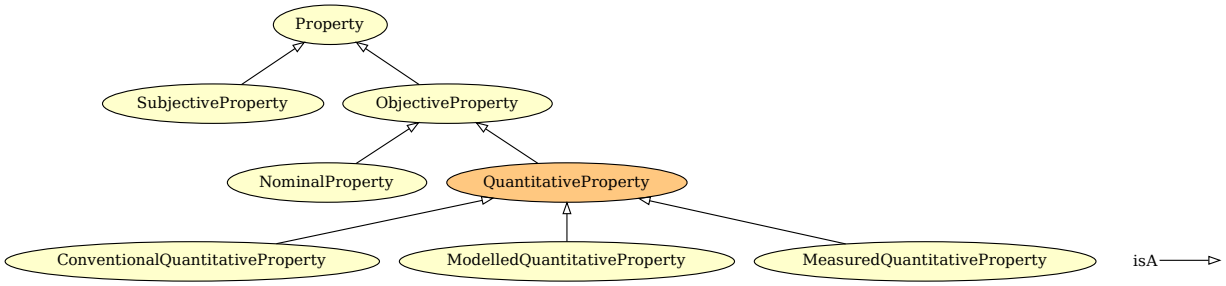

Figure 3.10: Property branch.

Definition: "A property of a phenomenon, body, or substance, where the property has a magnitude that can be expressed by means of a number and a reference" ISO 80000-1

"A reference can be a measurement unit, a measurement procedure, a reference material, or a combination of such." International vocabulary of metrology (VIM)

Elucidation: A 'Quantity' that can be quantified with respect to a standardized reference physical instance (e.g. the prototype meter bar, the kg prototype) or method (e.g. resilience) through a measurement process.

Comment: A quantitative property is always expresssed as a quantity (i.e. a number and a reference unit). For the EMMO, a nominalistic ontology, there is no property as abstract object.

A property is a sign that stands for an object according to a specific code shared by some observers.

For quantititative properties, one possible code that is shared between the scientific community (the observers) is the SI system of units.

Comment: Subclasses of 'QuantitativeProperty' classify objects according to the type semiosis that is used to connect the property to the object (e.g. by measurement, by convention, by modelling).

Relations:

- is_a metrology.Quantity
- is_a properties.ObjectiveProperty
- equivalent_to properties.MeasuredQuantitativeProperty or properties.ModelledQuantitativeProperty or properties.ConventionalQuantitativeProperty

ConventionalQuantitativeProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_d8aa8e1f_b650_416d_88a0_5118de945456

Elucidation: A quantitative property attributed by agreement to a quantity for a given purpose.

Example: The thermal conductivity of a copper sample in my laboratory can be assumed to be the conductivity that appears in the vendor specification. This value has been obtained by measurement of a sample which is not the one I have in my laboratory. This conductivity value is then a conventional quantitiative property assigned to my sample through a semiotic process in which no actual measurement is done by my laboratory.

If I don't believe the vendor, then I can measure the actual thermal conductivity. I then perform a measurement process that semiotically assign another value for the conductivity, which is a measured property, since is part of a measurement process.

Then I have two different physical quantities that are properties thanks to two different semiotic processes.

Comment: A property that is associated to an object by convention, or assumption.

Relations:

- is_a metrology.QuantitativeProperty

Property

IRI: http://emmo.info/emmo/middle/properties#EMMO_b7bcff25_ffc3_474e_9ab5_01b1664bd4ba

Elucidation: A 'Perceptual' referring to a specific code that is used as 'Conventional' sign to represent an 'Object' according to a specific interaction mechanism by an 'Observer'.

(A property is always a partial representation of an 'Object' since it reflects the 'Object' capability to be part of a specific 'Observation' process)

Example: Hardness is a subclass of properties.

Vickers hardness is a subclass of hardness that involves the procedures and instruments defined by the standard hardness test.

Example: Let's define the class 'colour' as the subclass of the properties that involve photon emission and an electromagnetic radiation sensible observer.

An individual C of this class 'colour' can be defined be declaring the process individual (e.g. daylight illumination) and the observer (e.g. my eyes)

Stating that an entity E hasProperty C, we mean that it can be observed by such setup of process + observer (i.e. observed by my eyes under daylight).

This definition can be generalized by using a generic human eye, so that the observer can be a generic human.

This can be used in material characterization, to define exactly the type of measurement done, including the instrument type.

Comment: A 'Property' is a sort of name or label that we put upon objects that interact with an observer in the same specific way.

e.g. "hot" objects are objects that interact with an observer through a perception mechanism aimed to perceive an heat source.

Comment: We know real world entities through observation/perception.

A non-perceivable real world entity does not exist (or it exists on a plane of existance that has no intersection with us and we can say nothing about it).

Perception/observation of a real wolrd entity occurs when the entity stimulate an observer in a peculiar way through a well defined perception channel.

For this reason each property is related to a specific observation process which involves a specific observer with its own perception mechanisms.

The observation process (e.g. a look, a photo shot, a measurement) is performed by an observer (e.g. you, a camera, an instrument) through a specific perception mechanism (e.g. retina impression, CMOS excitation, piezoelectric sensor activation) and involves an observed entity.

An observation is a semiotic process, since it stimulate an interpretant within the interpreter who can communicate the perception result to other interpreters through a sign which is the property.

Property subclasses are specializations that depend on the type of observation processes.

e.g. the property 'colour' is related to a process that involves emission or interaction of photon and an observer who can perceive electromagnetic radiation in the visible frequency range.

Properties usually relies on symbolic systems (e.g. for colour it can be palette or RGB).

Relations:

- is_a semiotics.Conventional
- Inverse(holistic.hasParticipant) some properties.Observation
- Inverse(properties.hasProperty) some semiotics.Object
- disjoint_union_of properties.SubjectiveProperty, properties.ObjectiveProperty

NominalProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_909415d1_7c43_4d5e_bbeb_7e1910159f66

Elucidation: An 'ObjectiveProperty' that cannot be quantified.

Example: CFC is a 'sign' that stands for the fact that the morphology of atoms composing the microstructure of an entity is predominantly Cubic Face Centered

A color is a nominal property.

Sex of a human being.

Comment: "Property of a phenomenon, body, or substance, where the property has no magnitude."

"A nominal property has a value, which can be expressed in words, by alphanumerical codes, or by other means."

International vocabulary of metrology (VIM)

Relations:

- is_a properties.ObjectiveProperty

ObjectiveProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_2a888cdf_ec4a_4ec5_af1c_0343372fc978

Elucidation: A 'Property' that is determined by each 'Observer' following a well defined 'Observation' procedure through a specific perception channel.

Comment: The word objective does not mean that each observation will provide the same results. It means that the observation followed a well defined procedure.

Comment: This class refers to what is commonly known as physical property, i.e. a measurable property of physical system, whether is quantifiable or not.

Relations:

- is_a properties.Property

ModelledQuantitativeProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_d0200cf1_e4f4_45ae_873f_b9359daea3cd

Relations:

- is_a metrology.QuantitativeProperty

SubjectiveProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_251cfb4f_5c75_4778_91ed_6c8395212fd8

Elucidation: A 'Property' that cannot be univocally determined and depends on an agent (e.g. a human individual, a community) acting as black-box.

Example: The beauty of that girl. The style of your clothing.

Comment: The word subjective means that a non-well defined or an unknown procedure is used for the definition of the property.

This happens due to e.g. the complexity of the object, the lack of a underlying model for the representation of the object, the non-well specified meaning of the property symbols.

A 'SubjectiveProperty' cannot be used to univocally compare 'Object'-s.

e.g. you cannot evaluate the beauty of a person on objective basis.

Relations:

- is_a properties.Property

MeasuredQuantitativeProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_873b0ab3_88e6_4054_b901_5531e01f14a4

Relations:

- is_a metrology.QuantitativeProperty

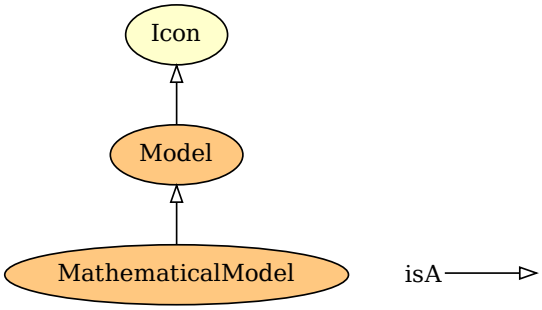

Figure 3.11: Icon branch.

Icon branch

Model

IRI: http://emmo.info/emmo/middle/models#EMMO_939483b1_0148_43d1_8b35_851d2cd5d939

Elucidation: A 'sign' that not only stands for a 'physical' or a 'process', but it is also a simplified representation, aimed to assist calculations for its description or for predictions of its behaviour.

A 'model' represents a 'physical' or a 'process' by direct similitude (e.g. small scale replica) or by capturing in a logical framework the relations between its properties (e.g. mathematical model).

Comment: A 'model' prediction is always a prediction of the properties of an entity, since an entity is known by an interpreter only through perception.

Relations:

- is_a semiotics.Icon
- equivalent_to Inverse(models.hasModel) some physical.Physical

Icon

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_d7788d1a_020d_4c78_85a1_13563fcec168

Elucidation: A 'Sign' that stands for an 'Object' by resembling or imitating it, in shape or by sharing a similar logical structure.

Example: A picture that reproduces the aspect of a person.

An equation that reproduces the logical connection of the properties of a physical entity.

Comment: Three subtypes of icon are possible:

(a) the image, which depends on a simple quality (e.g. picture)

(b) the diagram, whose internal relations, mainly dyadic or so taken, represent by analogy the relations in something (e.g. math formula, geometric flowchart)

(c) the metaphor, which represents the representative character of a sign by representing a parallelism in something else

[Wikipedia]

Relations:

- is_a properties.Observation
- holistic.hasParticipant some metrology.QuantitativeProperty
- holistic.hasParticipant some properties.MeasurementInstrument

PhysicalPhenomenon

IRI: http://emmo.info/emmo/middle/models#EMMO_314d0bd5_67ed_437e_a609_36d46147cea7

Elucidation: A 'process' that is recognized by physical sciences and is catogrized accordingly.

Comment: While every 'process' in the EMMO involves physical objects, this class is devoted to represent real world objects that express a phenomenon relevant for the ontologist.

Relations:

- is_a holistic.Process

Experiment

IRI: http://emmo.info/emmo/middle/models#EMMO_22522299_4091_4d1f_82a2_3890492df6db

Elucidation: An experiment is a process that is intended to replicate a physical phenomenon in a controlled environment.

Relations:

- is_a properties.Observation
- holistic.hasParticipant some models.PhysicalPhenomenon

ContinuumManufacturing

IRI: http://emmo.info/emmo/middle/manufacturing#EMMO_71d1c8f0_c6e3_44b5_a4b6_1b74ff35698a

Elucidation: A manufacturing process whose product is the result of the combination of more substances.

Example: Synthesis of materials, the preparation of a cake.

Relations:

- is_a manufacturing.Manufacturing

Semiosis

IRI: http://emmo.info/emmo/middle/semiotics#EMMO_008fd3b2_4013_451f_8827_52bceab11841

Elucidation: A 'Process', that has participant an 'Interpreter', that is aimed to produce a 'Sign' representing another participant, the 'Object'.

Example: Me looking a cat and saying loud: "Cat!" → the semiosis process

me → interpreter cat → object (in Peirce semiotics) the cat perceived by my mind → interpretant "Cat!" → sign, the produced sign

Relations:

- is_a holistic.Process
- holistic.hasProperParticipant some semiotics.Interpreter
- holistic.hasProperParticipant some semiotics.Object
- holistic.hasProperParticipant some semiotics.Sign

Observation

IRI: http://emmo.info/emmo/middle/properties#EMMO_10a5fd39_06aa_4648_9e70_f962a9cb2069

Elucidation: A 'Semiosis' that involves an 'Observer' that perceives another 'Physical' (the 'Object') through a specific perception mechanism and produces a 'Property' (the 'Sign') that stands for the result of that particular perception.

Relations:

- is_a semiotics.Semiosis
- holistic.hasParticipant some properties.Observer
- holistic.hasParticipant some properties.Property

Process

IRI: http://emmo.info/emmo/middle/holistic#EMMO_43e9a05d_98af_41b4_92f6_00f79a09bfce

Elucidation: A temporal part of a physical that identifies a particular type of evolution in time.

Comment: A 'Process' is always a 'Physical', since a 'Void' does not have elements that evolves in time.

Comment: Following the common definition of process, the reader may think that every 'Physical' should be a process, since every 4D object always has a time dimension.

However, in the EMMO we restrict the meaning of the word process to 'Physical'-s whose evolution in time have a particular meaning for the ontologist (i.e. every 4D object unfolds in time, but not every 4D object may be of interest for the ontologist).

A 'Process' is not only something that unfolds in time (which is automatically represented in a 4D ontology), but something that has a meaning for the ontologist (i.e. that the ontologist can separate from the rest of the 4D physical for any reason).

Relations:

- is_a holistic.Holistic
- is_a physical.Physical
- holistic.hasParticipant some holistic.Participant

DiscreteManufacturing

IRI: http://emmo.info/emmo/middle/manufacturing#EMMO_8786cb47_8e1f_4968_9b15_f6d41fc51252

Elucidation: A manufacturing process aimed to the production of a device made of specific components.

Example: Assemblying a bicycle, building a car.

Relations:

- is_a manufacturing.Manufacturing

Theorization

IRI: http://emmo.info/emmo/middle/models#EMMO_6c739b1a_a774_4416_bb31_1961486fa9ed

Elucidation: The 'semiosis' process of interpreting a 'physical' and provide a complec sign, 'theory' that stands for it and explain it to another interpreter.

Relations:

- is_a properties.Observation

Manufacturing

IRI: http://emmo.info/emmo/middle/manufacturing#EMMO_a4d66059_5dd3_4b90_b4cb_10960559441b

Elucidation: The process of transforming raw materials into a product by the use of manual labor, machinery or chemical/biological processes.

Comment: From Latin manufacture: "made by hand".

Relations:

- is_a holistic.Process
- holistic.hasProperParticipant some manufacturing.Engineered

Perceptual branch

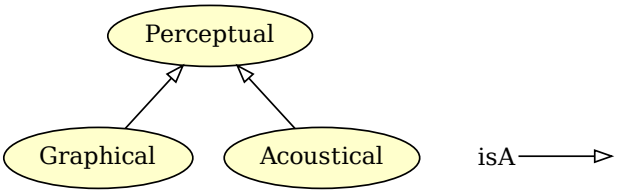

Figure 3.13: Perceptual branch.

Acoustical

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_4b3afb22_27cf_4ce3_88bc_492bfccb546b

Elucidation: A 'Perceptual' which stands for a real world object whose spatiotemporal pattern makes it identifiable by an observer as a sound.

Comment: 'acoustical' refers to the perception mechanism of the observer that can occur through a microphone, a ear.

Relations:

- is_a perceptual.Perceptual

Perceptual

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_649bf97b_4397_4005_90d9_219755d92e34

Elucidation: A 'Physical' which stands for a real world object that can stimulate a perception (e.g. a mental impression, the excitation of a sensor) to an interpreter (human or non-human).

Example: A line scratched on a surface. A sound. A smell. The word 'cat' and the sound of the word 'cat' (the first one is graphical and the second acoustical).

Example: The meta-semiotic process: I see a cloud in the sky. Since I'm an EMMO ontologist, I create an individual named Cloud under the 'Impression' class. This semiotic process occurs at meta-level: it's how I use the EMMO as tool for a direct representation of the world.

The semiotic process within EMMO: My friend looks at the same cloud and says: “It is an elephant”. I use the EMMO to record this experience by declaring: - my friend as MyFriend individual, belonging to ‘Interpreter’ classes - the sound of the word “elephant” as an acoustical impression individual named ElephantWord, belonging to ‘Impression’ - a relation hasSign between Cloud and ElephantWord, that makes ElephantWord also belonging to ‘Sign’ class and Cloud belonging also to ‘Object’ class - a ‘Semiosis’ individual called MyFriendElephantCloud that hasParticipant: Cloud, ElephantWord and MyFriend, respectively as object, sign and interpreter.

Comment: ‘Perceptual’ includes real world objects that: - are part of a communication system (e.g. words, speech, alphabets) - are not part of a communication system, but can be identified and referred by an interpreter

Comment: A ‘Perceptual’ is a meta-object, meaning that is addressed by the ontologist (the meta-interpreter) in a meta-semiotic process occurring outside the EMMO.

A ‘Perceptual’ becomes an ‘Object’, when it is part of a ‘Semiotic’ process described by the ontologist through the EMMO.

Comment: From Latin perceptiō (“a receiving or collecting, perception, comprehension”), from perceptus (“perceived, observed”).

Comment: This class is the most general superclass for the categorization of real world objects that are recognizable by an interpreter (agent).

A ‘Perceptual’ can stand for something else in a semiotic process (acting as sign or as object).

However, a perceptual is not necessarily a ‘Sign’ (e.g. a line sketched on a blackboard is a recognizable ‘Perceptual’ but it may stand for nothing).

Relations:

- is_a top.Perspective

Graphical branch

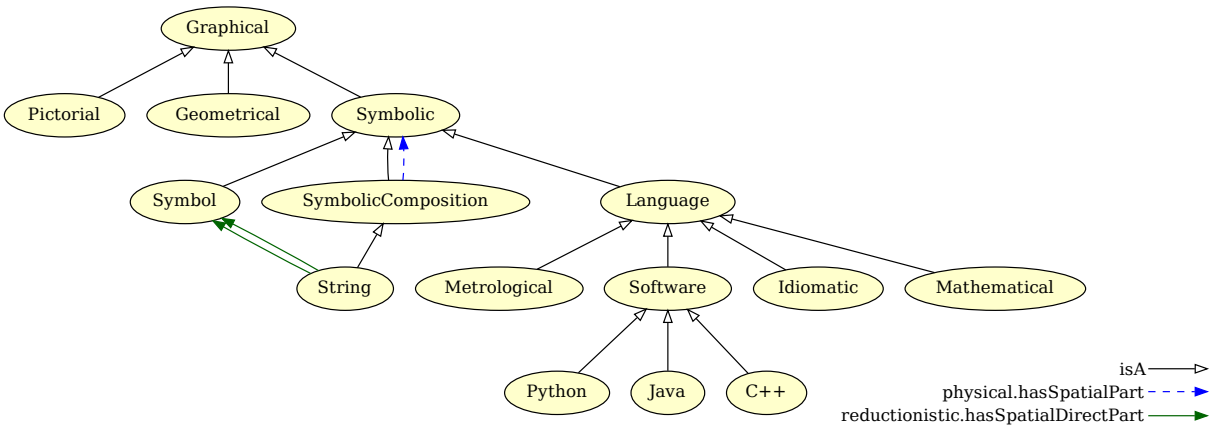

Figure 3.14: Graphical branch.

Language

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_d8d2144e_5c8d_455d_a643_5caf4d8d9df8

Elucidation: A language object is a symbolic object respecting a specific language syntactic rules (a well-formed formula).

Relations:

- is_a perceptual.Symbolic

Pictorial

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_1da53c06_9577_4008_8652_272fa3b62be7

Elucidation: A 'Graphical' that stands for a real world object that shows a recognizable pictorial pattern without being necessarily associated to a symbolic language.

Example: A drawing of a cat. A circle on a paper sheet. The Mona Lisa.

Relations:

- is_a perceptual.Graphical

Equation

IRI: http://emmo.info/emmo/middle/math#EMMO_e56ee3eb_7609_4ae1_8bed_51974f0960a6

Elucidation: The class of 'mathematical'-s that stand for a statement of equality between two mathematical expressions.

Example: 2+3 = 5 x^2 +3x = 5x dv/dt = a sin(x) = y

Comment: An equation with variables can always be represented as:

f(v0, v1, ..., vn) = g(v0, v1, ..., vn)

where f is the left hand and g the right hand side expressions and v0, v1, ..., vn are the variables.

Relations:

- is_a math.MathematicalFormula
- is_a reductionistic.State
- is_a math.Mathematical
- reductionistic.hasSpatialDirectPart some math.Expression

Symbolic

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_057e7d57_aff0_49de_911a_8861d85cef40

Elucidation: An 'Graphical' that stands for a token or a composition of tokens from one or more alphabets, without necessarily respecting syntactic rules.

Example: fe780 emmo !5*a cat for(i=0;i<N;++i)

Relations:

- is_a perceptual.Graphical

String

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_50ea1ec5_f157_41b0_b46b_a9032f17ca10

Elucidation: A physical made of more than one symbol sequentially arranged.

Example: The word "cat" considered as a collection of 'symbol'-s respecting the rules of english language.

In this example the 'symbolic' entity "cat" is not related to the real cat, but it is only a word (like it would be to an italian person that ignores the meaning of this english word).

If an 'interpreter' skilled in english language is involved in a 'semiotic' process with this word, that "cat" became also a 'sign' i.e. it became for the 'interpreter' a representation for a real cat.

Comment: A string is made of concatenated symbols whose arrangement is one-dimensional. Each symbol can have only one previous and one next neighborhood (bidirectional list).

Comment: A string is not requested to respect any syntactic rule: it's simply directly made of symbols.

Relations:

- is_a perceptual.SymbolicComposition
- is_a reductionistic.State
- reductionistic.hasSpatialDirectPart some perceptual.Symbol
- reductionistic.hasSpatialDirectPart only perceptual.Symbol

DefiningEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_29afdf54_90ae_4c98_8845_fa9ea3f143a8

Elucidation: An equation that define a new variable in terms of other mathematical entities.

Example: The definition of velocity as v = dx/dt.

The definition of density as mass/volume.

y = f(x)

Relations:

- is_a math.Equation

Graphical

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_c74da218_9147_4f03_92d1_8894abca55f3

Elucidation: A 'Perceptual' which stands for a real world object whose spatial configuration shows a pattern identifiable by an observer.

Example: 'Graphical' objects include writings, pictures, sketches …

Comment: From the Ancient Greek γραφή (graphḗ) which means drawing, painting, writing, a writing, description, and from γράφω (gráphō) which means scratch, carve.

Relations:

- is_a perceptual.Perceptual

ArithmeticEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_a6138ba7_e365_4f2d_b6b4_fe5a5918d403

Example: 1 + 1 = 2

Relations:

- is_a math.Equation

Python

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_add2e29d_6d87_4b78_9706_588e25557093

Relations:

- is_a perceptual.Software

AlgebricEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_98d65021_4574_4890_b2fb_46430841077f

Example: 2 * a - b = c

Comment: An 'equation' that has parts two 'polynomial'-s

Relations:

- is_a math.Equation
- reductionistic.hasSpatialDirectPart some math.AlgebricExpression

Java

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_09007bc0_b5f2_4fb9_af01_caf948cf2044

Relations:

Software

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_8681074a_e225_4e38_b586_e85b0f43ce38

Elucidation: A language object that follows syntactic rules of a programming language.

Relations:

- is_a perceptual.Language

Inequality

IRI: http://emmo.info/emmo/middle/math#EMMO_0b6ebe5a_0026_4bef_a1c1_5be00df9f98e

Elucidation: A relation which makes a non-equal comparison between two numbers or other mathematical expressions.

Example: f(x) > 0

Relations:

- is_a math.MathematicalFormula

MathematicalFormula

IRI: http://emmo.info/emmo/middle/math#EMMO_88470739_03d3_4c47_a03e_b30a1288d50c

Elucidation: A mathematical string that can be evaluated as true or false.

Relations:

- is_a math.Mathematical
- is_a perceptual.SymbolicComposition

IdiomaticSymbol

IRI: http://emmo.info/emmo/middle/metrology#EMMO_0a318776_b067_4de0_a2a6_cba2cf6333f8

Relations:

- is_a perceptual.Idiomatic
- is_a perceptual.Symbol
- equivalent_to perceptual.Idiomatic and perceptual.Symbol

SymbolicComposition

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_89a0c87c_0804_4013_937a_6fe234d9499c

Elucidation: A symbolic entity made of other symbolic entities according to a specific spatial configuration.

Comment: This class collects individuals that represents arrangements of strings, or other symbolic compositions, without any particular predifined arrangement schema.

Relations:

- is_a perceptual.Symbolic
- physical.hasSpatialPart some perceptual.Symbolic

PhysicsEquation

IRI: http://emmo.info/emmo/middle/models#EMMO_27c5d8c6_8af7_4d63_beb1_ec37cd8b3fa3

Elucidation: An 'equation' that stands for a 'physical_law' by mathematically defining the relations between physics_quantities.

Example: The Newton's equation of motion.

The Schrödinger equation.

The Navier-Stokes equation.

Relations:

- is_a math.Equation
- is_a models.MathematicalModel
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity
- Inverse(models.hasModel) some models.PhysicalPhenomenon

Idiomatic

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_48716718_225f_4c88_89e2_d819d30c90a2

Elucidation: A language object that follows syntactic rules of a an idiom (e.g. english, italian).

Relations:

- is_a perceptual.Language

C++

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_64aba1e5_24b7_4140_8eb4_676c35698e79

Elucidation: A language object respectin the syntactic rules of C++.

Relations:

- is_a perceptual.Software

MaterialRelation

IRI: http://emmo.info/emmo/middle/models#EMMO_e5438930_04e7_4d42_ade5_3700d4a52ab7

Elucidation: An 'equation' that stands for a physical assumption specific to a material, and provides an expression for a 'physics_quantity' (the dependent variable) as function of other variables, physics_quantity or data (independent variables).

Example: The Lennard-Jones potential.

A force field.

An Hamiltonian.

Comment: A material_relation can e.g. return a predefined number, return a database query, be an equation that depends on other physics_quantities.

Relations:

- is_a math.Equation
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity

FunctionDefinition

IRI: http://emmo.info/emmo/middle/math#EMMO_4bc29b0f_8fcc_4026_a291_f9774a66d9b8

Elucidation: A function defined using functional notation.

Example: y = f(x)

Relations:

- is_a math.DefiningEquation

Geometrical

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_b5957cef_a287_442d_a3ce_fd39f20ba1cd

Elucidation: A 'graphical' aimed to represent a geometrical concept.

Comment: A 'geometrical' stands for real world objects that express a geometrical concept.

This can be achieved in many different ways. For example, a line can be expressed by: a) an equation like y=mx+q, which is both an 'equation' and a 'geometrical' b) a line drawn with a pencil on a paper, which is simply a 'graphical' object c) a set of axioms, when the properties of a line are inferred by the interpreter reading them, that are both 'graphical' and also 'formula'

The case a) is a geometrical and mathematical, b) is geometrical and pictorial, while c) is geometrical and a composition of idiomatic strings.

Relations:

Symbol branch

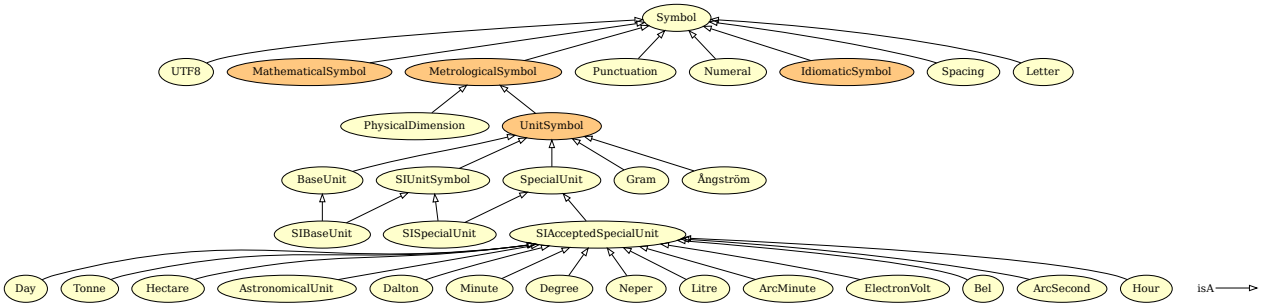

Figure 3.16: Symbol branch.

Symbol

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_a1083d0a_c1fb_471f_8e20_a98f881ad527

Elucidation: The class of individuals that stand for an elementary mark of a specific symbolic code (alphabet).

Example: The class of letter "A" is the symbol as idea and the letter A that you see on the screen is the mark.

Comment: Subclasses of 'Symbol' are alphabets, in formal languages terminology.

A 'Symbol' is atomic for that alphabet, i.e. it has no parts that are symbols for the same alphabet. e.g. a math symbol is not made of other math symbols

A Symbol may be a String in another language. e.g. "Bq" is the symbol for Becquerel units when dealing with metrology, or a string of "B" and "q" symbols when dealing with characters.

Comment: Symbols of a formal language need not be symbols of anything. For instance there are logical constants which do not refer to any idea, but rather serve as a form of punctuation in the language (e.g. parentheses).

Symbols of a formal language must be capable of being specified without any reference to any interpretation of them. (Wikipedia)

Comment: The class is the idea of the symbol, while the individual of that class stands for a specific mark (or token) of that idea.

Relations:

- is_a perceptual.Symbolic

Day

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_28ef05a7_ecc1_4df6_8116_c53251fbd4a8

Definition: A measure of time defined as 86 400 seconds.

Dbpediaentry: http://dbpedia.org/page/Day

Iupacentry: https://doi.org/10.1351/goldbook.D01527

MetrologicalSymbol

IRI: http://emmo.info/emmo/middle/metrology#EMMO_50a3552e_859a_4ff7_946d_76d537cabce6

Elucidation: A symbol that stands for a concept in the language of the meterological domain of ISO 80000.

Relations:

- is_a metrology.Metrological
- is_a perceptual.Symbol
- mereotopology.hasProperPart only not metrology.Metrological
- equivalent_to metrology.Metrological and perceptual.Symbol

SpecialUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_3ee80521_3c23_4dd1_935d_9d522614a3e2

Elucidation: A unit symbol that stands for a derived unit.

Example: Pa stands for N/m2 J stands for N m

Comment: Special units are semiotic shortcuts to more complex composed symbolic objects.

Relations:

- is_a metrology.DerivedUnit
- is_a metrology.UnitSymbol
- is_a semiotics.Sign
- Inverse(semiotics.hasSign) some metrology.DerivedUnit

Punctuation

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_a817035a_3e3c_4709_8ede_3205df3031a3

Relations:

Neper

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_b41515a9_28d8_4d78_8165_74b2fc72f89e

Definition: Unit of measurement for quantities of type level or level difference, which are defined as the natural logarithm of the ratio of power- or field-type quantities.

The value of a ratio in nepers is given by `ln(x1/x2)` where `x1` and `x2` are the values of interest (amplitudes), and ln is the natural logarithm. When the values are quadratic in the amplitude (e.g. power), they are first linearised by taking the square root before the logarithm is taken, or equivalently the result is halved.

- is_a siunits.SICoherentUnit
- disjoint_union_of siunits.SIBaseUnit, siunits.SISpecialUnit

UnitSymbol

IRI: http://emmo.info/emmo/middle/metrology#EMMO_216f448e_cdbc_4aeb_a529_7a5fe7fc38bb

Elucidation: A symbol that stands for a single unit.

Example: Some examples are “Pa”, “m” and “J”.

Relations:

- is_a metrology.MetrologicalSymbol
- is_a metrology.NonPrefixedUnit
- equivalent_to metrology.MeasurementUnit and perceptual.Symbol
- disjoint_union_of metrology.SpecialUnit, metrology.BaseUnit

Ångström

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_27c530c4_dfcd_486e_b324_54ad4448cd26

Definition: Measure of length defined as 1e-10 metres.

Altlabel: Angstrom

Comment: Ångström is not mentioned in the SI system and deprecated by the International Bureau of Weights and Measures (BIPM).

Dispite of that, it is often used in the natural sciences and technology.

Dbpediaentry: http://dbpedia.org/page/%C3%85ngstr%C3%B6m

Iupacentry: https://doi.org/10.1351/goldbook.N00350

Bel

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_6c7160fc_cc64_46f0_b43b_aba65e9952e3

Definition: One bel is defined as `½ ln(10) neper`.

Elucidation: Unit of measurement for quantities of type level or level difference.

Comment: Today decibel (one tenth of a bel) is commonly used instead of bel.

Comment: bel is used to express the ratio of one value of a power or field quantity to another, on a logarithmic scale, the logarithmic quantity being called the power level or field level, respectively.

Mathematical branch

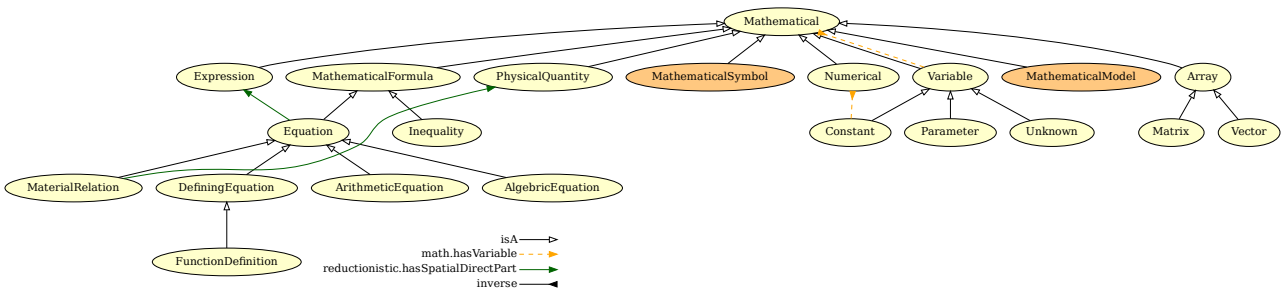

Figure 3.17: Mathematical branch.

Inequality

IRI: http://emmo.info/emmo/middle/math#EMMO_0b6ebe5a_0026_4bef_a1c1_5be00df9f98e

Elucidation: A relation which makes a non-equal comparison between two numbers or other mathematical expressions.

Example: f(x) > 0

Relations:

- is_a math.MathematicalFormula

Equation

IRI: http://emmo.info/emmo/middle/math#EMMO_e56ee3eb_7609_4ae1_8bed_51974f0960a6

Elucidation: The class of 'mathematical'-s that stand for a statement of equality between two mathematical expressions.

Example: 2+3 = 5 x^2 +3x = 5x dv/dt = a sin(x) = y

Comment: An equation with variables can always be represented as:

f(v0, v1, ..., vn) = g(v0, v1, ..., vn)

where f is the left hand and g the right hand side expressions and v0, v1, ..., vn are the variables.

Relations:

- is_a math.MathematicalFormula
- is_a reductionistic.State
- is_a math.Mathematical
- reductionistic.hasSpatialDirectPart some math.Expression

FunctionDefinition

IRI: http://emmo.info/emmo/middle/math#EMMO_4bc29b0f_8fcc_4026_a291_f9774a66d9b8

Elucidation: A function defined using functional notation.

Example: y = f(x)

Relations:

- is_a math.DefiningEquation

Variable

IRI: http://emmo.info/emmo/middle/math#EMMO_1eed0732_e3f1_4b2c_a9c4_b4e75eeb5895

Elucidation: A 'Variable' is a symbolic object that stands for a numerical defined 'Mathematical' object like e.g. a number, a vector, a matrix.

Example: x k

Relations:

- is_a math.Mathematical
- is_a semiotics.Conventional
- Inverse(math.hasVariable) some math.Mathematical

Array

IRI: http://emmo.info/emmo/middle/math#EMMO_28fbea28_2204_4613_87ff_6d877b855fcd%20

Relations:

- is_a math.Mathematical

MathematicalFormula

IRI: http://emmo.info/emmo/middle/math#EMMO_88470739_03d3_4c47_a03e_b30a1288d50c

Elucidation: A mathematical string that can be evaluated as true or false.

Relations:

- is_a math.Mathematical
- is_a perceptual.SymbolicComposition

Constant

IRI: http://emmo.info/emmo/middle/math#EMMO_ae15fb4f_8e4d_41de_a0f9_3997f89ba6a2

Elucidation: A 'varaible' that stand for a well known constant.

Example: π refers to the constant number ~3.14

Relations:

- is_a math.Variable
- Inverse(math.hasVariable) only math.Numerical

DefiningEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_29afdf54_90ae_4c98_8845_fa9ea3f143a8

Elucidation: An equation that define a new variable in terms of other mathematical entities.

Example: The definition of velocity as v = dx/dt.

The definition of density as mass/volume.

y = f(x)

Relations:

- is_a math.Equation

PhysicsEquation

IRI: http://emmo.info/emmo/middle/models#EMMO_27c5d8c6_8af7_4d63_beb1_ec37cd8b3fa3

Elucidation: An 'equation' that stands for a 'physical_law' by mathematically defining the relations between physics_quantities.

Example: The Newton's equation of motion.

The Schrödinger equation.

The Navier-Stokes equation.

Relations:

- is_a math.Equation
- is_a models.MathematicalModel
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity
- Inverse(models.hasModel) some models.PhysicalPhenomenon

ArithmeticEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_a6138ba7_e365_4f2d_b6b4_fe5a5918d403

Example: 1 + 1 = 2

Relations:

- is_a math.Equation

Matrix

IRI: http://emmo.info/emmo/middle/math#EMMO_1cba0b27_15d0_4326_933f_379d0b3565b6

Relations:

- is_a math.Array

MaterialRelation

IRI: http://emmo.info/emmo/middle/models#EMMO_e5438930_04e7_4d42_ade5_3700d4a52ab7

Elucidation: An 'equation' that stands for a physical assumption specific to a material, and provides an expression for a 'physics_quantity' (the dependent variable) as function of other variables, physics_quantity or data (independent variables).

Example: The Lennard-Jones potential.

A force field.

An Hamiltonian.

Comment: A material_relation can e.g. return a predefined number, return a database query, be an equation that depends on other physics_quantities.

Relations:

- is_a math.Equation
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity

Unknown

IRI: http://emmo.info/emmo/middle/math#EMMO_fe7e56ce_118b_4243_9aad_20eb9f4f31f6

Elucidation: The dependent variable for which an equation has been written.

Example: Velocity, for the Navier-Stokes equation.

Relations:

- is_a math.Variable

AlgebricEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_98d65021_4574_4890_b2fb_46430841077f

Example: 2 * a - b = c

Comment: An 'equation' that has parts two 'polynomial'-s

Relations:

- is_a math.Equation
- reductionistic.hasSpatialDirectPart some math.AlgebricExpression

Vector

IRI: http://emmo.info/emmo/middle/math#EMMO_06658d8d_dcde_4fc9_aae1_17f71c0bcdec

Relations:

- is_a math.Array

Mathematical

IRI: http://emmo.info/emmo/middle/math#EMMO_54ee6b5e_5261_44a8_86eb_5717e7fdb9d0

Elucidation: The class of general mathematical symbolic objects respecting mathematical syntactic rules.

Relations:

- is_a perceptual.Language

Numerical

IRI: http://emmo.info/emmo/middle/math#EMMO_4ce76d7f_03f8_45b6_9003_90052a79bfaa

Elucidation: A 'Mathematical' that has no unknown value, i.e. all its 'Variable"-s parts refers to a 'Number' (for scalars that have a built-in datatype) or to another 'Numerical' (for complex numerical data structures that should rely on external implementations).

Relations:

- is_a math.Mathematical

Parameter

IRI: http://emmo.info/emmo/middle/math#EMMO_d1d436e7_72fc_49cd_863b_7bfb4ba5276a

Example: viscosity in the Navier-Stokes equation

Comment: A 'variable' whose value is assumed to be known independently from the equation, but whose value is not explicitated in the equation.

Relations:

- is_a math.Variable

Mathematical Symbol branch

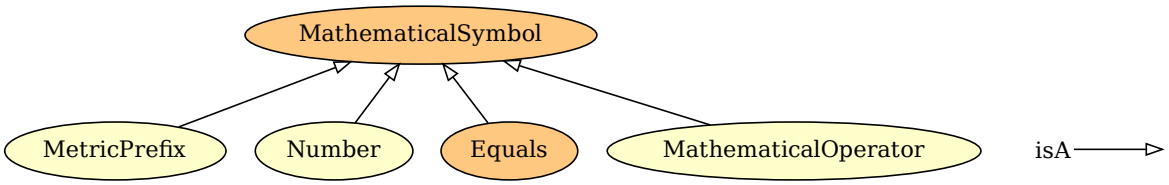

Figure 3.18: Mathematical Symbol branch.

MathematicalSymbol

IRI: http://emmo.info/emmo/middle/math#EMMO_5be83f9c_a4ba_4b9a_be1a_5bfc6e891231

- equivalent_to math.Mathematical and perceptual.Symbol

Equals

IRI: http://emmo.info/emmo/middle/math#EMMO_535d75a4_1972_40bc_88c6_ca566386934f

Elucidation: The equals symbol.

Relations:

- is_a math.MathematicalSymbol
- is_a math.Mathematical
- is_a perceptual.Symbol
- equivalent_to perceptual.hasSymbolData value "="

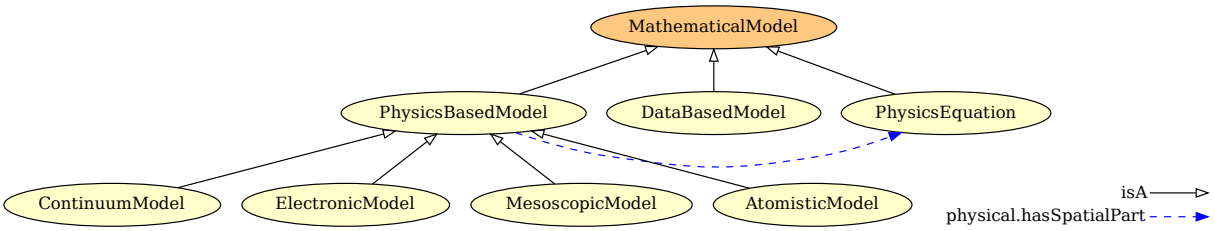

Figure 3.19: Mathematical Model branch.

Mathematical Model branch

ContinuumModel

IRI: http://emmo.info/emmo/middle/models#EMMO_4456a5d2_16a6_4ee1_9a8e_5c75956b28ea

Elucidation: A physics-based model based on a physics equation describing the behaviour of continuum volume.

Relations:

- is_a models.PhysicsBasedModel

ElectronicModel

IRI: http://emmo.info/emmo/middle/models#EMMO_6eca09be_17e9_445e_abc9_000aa61b7a11

Elucidation: A physics-based model based on a physics equation describing the behaviour of electrons.

Example: Density functional theory. Hartree-Fock.

Relations:

- is_a models.PhysicsBasedModel

PhysicsBasedModel

IRI: http://emmo.info/emmo/middle/models#EMMO_b29fd350_39aa_4af7_9459_3faa0544cba6

Elucidation: A solvable set of one Physics Equation and one or more Materials Relations.

Relations:

- is_a models.MathematicalModel
- physical.hasSpatialPart some models.PhysicsEquation
- physical.hasSpatialPart some models.MaterialRelation

DataBasedModel

IRI: http://emmo.info/emmo/middle/models#EMMO_a4b14b83_9392_4a5f_a2e8_b2b58793f59b

Elucidation: A computational model that uses existing data to create new insight into the behaviour of a system.

Relations:

- is_a models.MathematicalModel

PhysicsEquation

IRI: http://emmo.info/emmo/middle/models#EMMO_27c5d8c6_8af7_4d63_beb1_ec37cd8b3fa3

Elucidation: An 'equation' that stands for a 'physical_law' by mathematically defining the relations between physics_quantities.

Example: The Newton's equation of motion.

The Schrödinger equation.

The Navier-Stokes equation.

Relations:

- is_a math.Equation
- is_a models.MathematicalModel
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity
- Inverse(models.hasModel) some models.PhysicalPhenomenon

MesoscopicModel

IRI: http://emmo.info/emmo/middle/models#EMMO_53935db0_af45_4426_b9e9_244a0d77db00

Elucidation: A physics-based model based on a physics equation describing the behaviour of mesoscopic entities, i.e. a set of bounded atoms like a molecule, bead or nanoparticle.

Relations:

- is_a models.PhysicsBasedModel

AtomisticModel

IRI: http://emmo.info/emmo/middle/models#EMMO_84cadc45_6758_46f2_ba2a_5ead65c70213

Elucidation: A physics-based model based on a physics equation describing the behaviour of atoms.

Relations:

- is_a models.PhysicsBasedModel

MathematicalModel

IRI: http://emmo.info/emmo/middle/models#EMMO_f7ed665b_c2e1_42bc_889b_6b42ed3a36f0

Comment: A mathematical model can be defined as a description of a system using mathematical concepts and language to facilitate proper explanation of a system or to study the effects of different components and to make predictions on patterns of behaviour.

Abramowitz and Stegun, 1968

Relations:

- is_a math.Mathematical
- is_a models.Model
- equivalent_to math.Mathematical and models.Model

AstronomicalUnit

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_053648ea_3c0a_468c_89cb_eb009239323a

Definition: One astronomical unit is defined as exactly 149597870700 m, which is roughly the distance from earth to sun.

Dbpediaentry: http://dbpedia.org/page/Astronomical_unit

Qudtentry: http://qudt.org/vocab/unit/PARSEC

Metrological

IRI: http://emmo.info/emmo/middle/metrology#EMMO_985bec21_989f_4b9e_a4b3_735d88099c3c

Elucidation: A language object used in metrology.

Comment: Metrology includes all theoretical and practical aspects of measurement, whatever the measurement uncertainty and field of application.

– International vocabulary of metrology (VIM)

Comment: This language domain makes use of ISO 80000 concepts.

Relations:

- is_a perceptual.Language

Dalton

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_00dd79e0_31a6_427e_9b9c_90f3097e4a96

Definition: One dalton is defined as one twelfth of the mass of an unbound neutral atom of carbon-12 in its nuclear and electronic ground state.

Dbpediaentry: http://dbpedia.org/page/Unified_atomic_mass_unit

Iupacentry: https://doi.org/10.1351/goldbook.D01514

Qudtentry: http://qudt.org/vocab/unit/Dalton

MetrologicalSymbol

IRI: http://emmo.info/emmo/middle/metrology#EMMO_50a3552e_859a_4ff7_946d_76d537cabce6

Elucidation: A symbol that stands for a concept in the language of the meterological domain of ISO 80000.

Relations:

- is_a metrology.Metrological
- is_a perceptual.Symbol
- mereotopology.hasProperPart only not metrology.Metrological
- equivalent_to metrology.Metrological and perceptual.Symbol

SpecialUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_3ee80521_3c23_4dd1_935d_9d522614a3e2

Elucidation: A unit symbol that stands for a derived unit.

Example: Pa stands for N/m2 J stands for N m

Comment: Special units are semiotic shortcuts to more complex composed symbolic objects.

Relations:

- is_a metrology.DerivedUnit
- is_a metrology.UnitSymbol
- is_a semiotics.Sign
- Inverse(semiotics.hasSign) some metrology.DerivedUnit

Bel

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_6c7160fc_cc64_46f0_b43b_aba65e9952e3

Definition: One bel is defined as ½ `ln(10) neper`.

Elucidation: Unit of measurement for quantities of type level or level difference.

Comment: Today decibel (one tenth of a bel) is commonly used instead of bel.

Comment: bel is used to express the ratio of one value of a power or field quantity to another, on a logarithmic scale, the logarithmic quantity being called the power level or field level, respectively.

Qudtentry: http://qudt.org/vocab/unit/B

Wikipediaentry: https://en.wikipedia.org/wiki/Decibel

Relations:

- is_a units-extension.SIAcceptedSpecialUnit

Neper

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_b41515a9_28d8_4d78_8165_74b2fc72f89e

Definition: Unit of measurement for quantities of type level or level difference, which are defined as the natural logarithm of the ratio of power- or field-type quantities.

The value of a ratio in nepers is given by `ln(x1/x2)` where `x1` and `x2` are the values of interest (amplitudes), and ln is the natural logarithm. When the values are quadratic in the amplitude (e.g. power), they are first linearised by taking the square root before the logarithm is taken, or equivalently the result is halved.

Wikipedia

Dbpediaentry: http://dbpedia.org/page/Neper

ReferenceUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_18ce5200_00f5_45bb_8c6f_6fb128cd41ae

Comment: A reference can be a measurement unit, a measurement procedure, a reference material, or a combination of such. International vocabulary of metrology (VIM)

Comment: A symbolic is recognized as reference unit also if it is not part of a quatity (e.g. as in the sentence “the Bq is the reference unit of Becquerel”).

For this reason we can’t declare the axiom: ReferenceUnit SubClassOf: inverse(hasReferenceUnit) some Quantity because there exist reference units without being part of a quantity.

This is peculiar to EMMO, where quantities (symbolic) are distinct with properties (semiotics).

Relations:

- is_a metrology.Metrological

ProcedureUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_c9c8f824_9127_4f93_bc21_69fe78a7f6f2

Elucidation: A reference unit provided by a measurement procedure.

Example: Rockwell C hardness of a given sample (150 kg load): 43.5HRC(150 kg)

Relations:

- is_a metrology.ReferenceUnit

StandardUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_acd1a504_ca32_4f30_86ad_0b62cea5bc02

Elucidation: A reference unit provided by a reference material. International vocabulary of metrology (VIM)

Example: Arbitrary amount-of-substance concentration of lutropin in a given sample of plasma (WHO international standard 80/552): 5.0 International Unit/l

Relations:

- is_a metrology.ReferenceUnit

ArcSecond

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_6a4547ab_3abb_430d_b81b_ce32d47729f5

PhysicalDimension

IRI: http://emmo.info/emmo/middle/metrology#EMMO_9895a1b4_f0a5_4167_ac5e_97db40b8bfcc

Elucidation: A symbol that, following SI specifications, describe the physical dimensionality of a physical quantity and the exponents of the base units in a measurement unit.

Comment: All physical quantities, with the exception of counts, are derived quantities, which may be written in terms of base quantities according to the equations of physics. The dimensions of the derived quantities are written as products of powers of the dimensions of the base quantities using the equations that relate the derived quantities to the base quantities. In general the dimension of any quantity Q is written in the form of a dimensional product,

dim Q = T^α L^β M^γ I^δ Θ^ϵ N^ζ J^η

where the exponents α, β, γ, δ, ϵ, ζ and η, which are generally small integers, which can be positive, negative, or zero, are called the dimensional exponents. (SI brochure)

Comment: The conventional symbolic representation of the dimension of a base quantity is a single upper case letter in roman (upright) type. The conventional symbolic representation of the dimension of a derived quantity is the product of powers of the dimensions of the base quantities according to the definition of the derived quantity. The dimension of a quantity Q is denoted by dim Q. ISO 80000-1

Comment: The expression used by the EMMO for physical dimensions is a metrological symbol (but a string at meta level, i.e. the ontologist level) like this:

Ta Lb Mc Id Θe Nf Jg

where a, b, c, d, e, f and g are 0 or signed integers.

Regex for the physical dimension symbol for the EMMO is: ^T([+-][1-9]|0) L([+-][1-9]|0) M([+-][1-9]|0) I([+-][1-9]|0) Θ([+-][1-9]|0) N([+-][1-9]|0) J([+-][1-9]|0)$

Examples of correspondance between base units and physical dimensions are: mol → T0 L0 M0 I0 Θ0 N+1 J0 s → T+1 L0 M0 I0 Θ0 N0 J0 A/m2 → T0 L0 M-2 I+1 Θ0 N0 J0

Radioactivity

IRI: http://emmo.info/emmo/middle/isq#EMMO_8d3da9ac_2265_4382_bee5_db72046722f8

Elucidation: Decays per unit time.

Iupacentry: https://doi.org/10.1351/goldbook.A00114

Physicaldimension: T-1 L0 M0 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/SpecificActivity

Relations:

- is_a isq.ISQDerivedQuantity

CatalyticActivity

IRI: http://emmo.info/emmo/middle/isq#EMMO_bd67d149_24c2_4bc9_833a_c2bc26f98fd3

Elucidation: Increase in the rate of reaction of a specified chemical reaction that an enzyme produces in a specific assay system.

Iupacentry: https://doi.org/10.1351/goldbook.C00881

Physicaldimension: T-1 L0 M0 I0 Θ0 N+1 J0

Qudtentry: http://qudt.org/vocab/quantitykind/CatalyticActivity

Relations:

- is_a isq.ISQDerivedQuantity

LuminousIntensity

IRI: http://emmo.info/emmo/middle/isq#EMMO_50bf79a6_a48b_424d_9d2c_813bd631231a

Elucidation: A measure of the wavelength-weighted power emitted by a light source in a particular direction per unit solid angle. It is based on the luminosity function, which is a standardized model of the sensitivity of the human eye.

Dbpediaentry: http://dbpedia.org/page/Luminous_intensity

Physicaldimension: T0 L0 M0 I0 Θ0 N0 J+1

Qudtentry: http://qudt.org/vocab/quantitykind/Length

Relations:

- is_a isq.ISQBaseQuantity

Torque

IRI: http://emmo.info/emmo/middle/isq#EMMO_aaf9dd7f_0474_40d0_9606_02def8515249

Elucidation: The effectiveness of a force to produce rotation about an axis, measured by the product of the force and the perpendicular distance from the line of action of the force to the axis.

Iecentry: http://www.electropedia.org/iev/iev.nsf/display?openform&ievref=113-03-26

Comment: Even though torque has the same physical dimension as energy, it is not of the same kind and can not be measured with energy units like joule or electron volt.

Dbpediaentry: http://dbpedia.org/page/Torque

Iupacentry: https://doi.org/10.1351/goldbook.T06400

Ommatch: http://www.ontology-of-units-of-measure.org/resource/om-2/Torque

Physicaldimension: T-2 L+2 M+1 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/Torque

Relations:

- is_a isq.ISQDerivedQuantity

PureNumberQuantity

IRI: http://emmo.info/emmo/middle/isq#EMMO_ba882f34_0d71_4e4f_9d92_0c076c633a2c

Elucidation: A pure number, typically the number of something.

Example: 1, i, π, the number of protons in the nucleus of an atom

Comment: According to the SI brochure counting does not automatically qualify a quantity as an amount of substance.

This quantity is used only to describe the outcome of a counting process, without regard of the type of entities.

"There are also some quantities that cannot be described in terms of the seven base quantities of the SI, but have the nature of a count. Examples are a number of molecules, a number of cellular or biomolecular entities (for example copies of a particular nucleic acid sequence), or degeneracy in quantum mechanics. Counting quantities are also quantities with the associated unit one."

AmountOfSubstance

IRI: http://emmo.info/emmo/middle/isq#EMMO_8159c26a_494b_4fa0_9959_10888f152298

Elucidation: The number of elementary entities present.

Comment: "In the name "amount of substance", the word "substance" will typically be replaced by words to specify the substance concerned in any particular application, for example "amount of hydrogen chloride, HCl", or "amount of benzene, C6H6". It is important to give a precise definition of the entity involved (as emphasized in the definition of the mole); this should preferably be done by specifying the molecular chemical formula of the material involved. Although the word "amount" has a more general dictionary definition, the abbreviation of the full name "amount of substance" to "amount" may be used for brevity."

ElectricCurrent

IRI: http://emmo.info/emmo/middle/isq#EMMO_c995ae70_3b84_4ebb_bcfc_69e6a281bb88

Elucidation: A flow of electric charge.

Dbpediaentry: http://dbpedia.org/page/Electric_current

Iupacentry: https://doi.org/10.1351/goldbook.E01927

Physicaldimension: T0 L0 M0 I+1 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/ElectricCurrent

Relations:

- is_a isq.ISQBaseQuantity

AtomicNumber

IRI: http://emmo.info/emmo/middle/isq#EMMO_07de47e0_6bb6_45b9_b55a_4f238efbb105

Definition: Number of protons in an atomic nucleus.

Dbpediaentry: http://dbpedia.org/page/Atomic_number

Iupacentry: https://doi.org/10.1351/goldbook.A00499

Physicaldimension: T0 L0 M0 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/AtomicNumber

Relations:

- is_a isq.PureNumberQuantity

PlanckConstant

IRI: http://emmo.info/emmo/middle/isq#EMMO_76cc4efc_231e_42b4_be83_2547681caed6

Elucidation: The quantum of action. It defines the kg base unit in the SI system.

Codataentry: https://physics.nist.gov/cgi-bin/cuu/Value?h

Dbpediaentry: http://dbpedia.org/page/Planck_constant

Iupacentry: https://doi.org/10.1351/goldbook.P04685

Physicaldimension: T-1 L+2 M+1 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/constant/PlanckConstant

Relations:

- is_a isq.AngularMomentum
- is_a isq.SIExactConstant

ElectricReactance

IRI: http://emmo.info/emmo/middle/isq#EMMO_92b2fb85_2143_4bc7_bbca_df3e6944bfc1

Altlabel: Reactance

Comment: The opposition of a circuit element to a change in current or voltage, due to that element's inductance or capacitance.

Dbpediaentry: http://dbpedia.org/page/Electrical_reactance

Physicaldimension: T-3 L+2 M+1 I-2 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/Reactance

Relations:

- is_a isq.ElectricResistance

ElectricResistance

IRI: http://emmo.info/emmo/middle/isq#EMMO_e88f75d6_9a17_4cfc_bdf7_43d7cea5a9a1

Elucidation: Measure of the difficulty to pass an electric current through a material.

Altlabel: Resistance

Comment: Inverse of 'ElectricalConductance'.

Dbpediaentry: http://dbpedia.org/page/Electrical_resistance_and_conductance

Iupacentry: https://doi.org/10.1351/goldbook.E01936

Physicaldimension: T-3 L+2 M+1 I-2 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/Resistance

Relations:

- is_a isq.ISQDerivedQuantity

Enthalpy

IRI: http://emmo.info/emmo/middle/isq#EMMO_4091d5ec_a4df_42b9_a073_9a090839279f

Comment: Measurement of energy in a thermodynamic system.

Dbpediaentry: http://dbpedia.org/page/Enthalpy

Iupacentry: https://doi.org/10.1351/goldbook.E02141

Physicaldimension: T-2 L+2 M+1 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/Enthalpy

Relations:

- is_a isq.Energy

MassFraction

IRI: http://emmo.info/emmo/middle/isq#EMMO_7c055d65_2929_40e1_af4f_4bf10995ad50

Comment: Mass of a constituent divided by the total mass of all constituents in the mixture.

Dbpediaentry: http://dbpedia.org/page/Mass_fraction_(chemistry)

Iupacentry: https://doi.org/10.1351/goldbook.M03722

Ommatch: http://www.ontology-of-units-of-measure.org/resource/om-2/MassFraction

Physicaldimension: T0 L0 M0 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/MassFraction

Relations:

- metrology.hasReferenceUnit only units-extension.MassFractionUnit

Stress

IRI: http://emmo.info/emmo/middle/isq#EMMO_d1917609_db5e_4b8a_9b76_ef1d6f860a81

Comment: Force per unit oriented surface area .

Comment: Measure of the internal forces that neighboring particles of a continuous material exert on each other.

Dbpediaentry: http://dbpedia.org/page/Stress_(mechanics)

Physicaldimension: T-2 L-1 M+1 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/Stress

Relations:

- is_a isq.ISQDerivedQuantity

RatioQuantity

IRI: http://emmo.info/emmo/middle/isq#EMMO_faab3f84_e475_4a46_af9c_7d249f0b9aef

Elucidation: The class of quantities that are the ratio of two quantities with the same physical dimensionality.

Example: refractive index, volume fraction, fine structure constant

Comment: Quantities defined as ratios `Q=A/B` having equal dimensions in numerator and denominator are dimensionless quantities but still have a physical dimension defined as dim(A)/dim(B).

Johansson, Ingvar (2010). “Metrological thinking needs the notions of parametric quantities, units and dimensions”. Metrologia. 47 (3): 219–230. doi:10.1088/0026-1394/47/3/012. ISSN 0026-1394.

Physicaldimension: T0 L0 M0 I0 Θ0 N0 J0

Seealso: https://iopscience.iop.org/article/10.1088/0026-1394/47/3/012

Relations:

PhysicalQuantity

IRI: http://emmo.info/emmo/middle/metrology#EMMO_02c0621e_a527_4790_8a0f_2bb51973c819

Elucidation: A 'Mathematical' entity that is made of a 'Numeral' and a 'MeasurementUnit' defined by a physical law, connected to a physical entity through a model perspective. Measurement is done according to the same model.

Comment: In the same system of quantities, dim ρB = ML-3 is the quantity dimension of mass concentration of component B, and ML-3 is also the quantity dimension of mass density, ρ. ISO 80000-1

Comment: Measured or simulated 'physical propertiy'-s are always defined by a physical law, connected to a physical entity through a model perspective and measurement is done according to the same model.

Systems of units suggests that this is the correct approach, since except for the fundamental units (length, time, charge) every other unit is derived by mathematical relations between these fundamental units, implying a physical laws or definitions.

Comment: Measurement units of quantities of the same quantity dimension may be designated by the same name and symbol even when the quantities are not of the same kind.

For example, joule per kelvin and J/K are respectively the name and symbol of both a measurement unit of heat capacity and a measurement unit of entropy, which are generally not considered to be quantities of the same kind.

However, in some cases special measurement unit names are restricted to be used with quantities of specific kind only.

For example, the measurement unit 'second to the power minus one' (1/s) is called hertz (Hz) when used for frequencies and becquerel (Bq) when used for activities of radionuclides.

As another example, the joule (J) is used as a unit of energy, but never as a unit of moment of force, i.e. the newton metre (N · m).

Comment: — quantities of the same kind have the same quantity dimension, — quantities of different quantity dimensions are always of different kinds, and — quantities having the same quantity dimension are not necessarily of the same kind. ISO 80000-1

Number

IRI: http://emmo.info/emmo/middle/math#EMMO_21f56795_ee72_4858_b571_11cfaa59c1a8

Elucidation: A numerical data value.

Comment: A number is actually a string (e.g. 1.4, 1e-8) of numerical digits and other symbols. However, in order not to increase complexity of the taxonomy and relations, here we take a number as an "atomic" object (i.e. we do not include digits in the EMMO as alphabet for numbers).

A 'Number' individual provide the link between the ontology and the actual data, through the data property hasNumericalValue.

Comment: In math usually number and numeral are distinct concepts, the numeral being the symbol or a composition of symbols (e.g. 3.14, 010010, three) and the number is the idea behind it.

More than one numeral stand for the same number.

In the EMMO abstract entities does not exists, and numbers are simply defined by other numerals, so that a number is the class of all the numerals that are equivalent (e.g. 3 and 0011 are numerals that stands for the same number).

Or alternatively, an integer numeral may also stands for a set of a specific cardinality (e.g. 3 stands for a set of three apples). Rational and real numbers are simply a syntactic arrangment of integers (digits, in decimal system).

The fact that you can't give a name to a number without using a numeral or, in case of positive integers, without referring to a real world objects set with specific cardinality, suggests that the abstract concept of number is not a concept that can be practically used.

For these reasons, the EMMO will consider numerals and numbers as the same concept.

SICoherentUnit

IRI: http://emmo.info/emmo/middle/siunits#EMMO_707c6032_e272_4a20_98b5_d35c4f67be68

Comment: Derived units are defined as products of powers of the base units. When the numerical factor of this product is one, the derived units are called coherent derived units. The base and coherent derived units of the SI form a coherent set, designated the set of coherent SI units.

Relations:

- is_a metrology.NonPrefixedUnit
- is_a siunits.SIUnit
- disjoint_union_of siunits.SICoherentDerivedUnit, siunits.SIBaseUnit, siunits.SISpecialUnit

MeasurementUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_b081b346_7279_46ef_9a3d_2c088fcd79f4

Elucidation: A 'Quantity' that stands for the standard reference magnitude of a specific class of measurement processes, defined and adopted by convention or by law.

The numerical quantity value of the 'MeasurementUnit' is conventionally 1 and does not appear.

Quantitative measurement results are expressed as a multiple of the 'MeasurementUnit'.

Comment: "Real scalar quantity, defined and adopted by convention, with which any other quantity of the same kind can be compared to express the ratio of the second quantity to the first one as a number" ISO 80000-1

Comment: "Unit symbols are mathematical entities and not abbreviations."

"Symbols for units are treated as mathematical entities. In expressing the value of a quantity as the product of a numerical value and a unit, both the numerical value and the unit may be treated by the ordinary rules of algebra."

https://www.bipm.org/utils/common/pdf/si-brochure/SI-Brochure-9-EN.pdf

Comment: While the SI brochure treats 'MeasurementUnit' as a 'PhysicalQuantity', in the EMMO this is not possible since the latter always has two direct parts, a 'Numerical' and a 'MeasurementUnit', while the former a single 'Symbol'.

SI distinguishes between a quantity (an abstract concept) and the quantity value (a number and a reference). The EMMO, following strict nominalism, considers a SI quantity as a SI quantity value, collapsing the two concepts into one: the 'Quantity'.

So, for the EMMO the symbol "kg" is not a physical quantity but a 'MeasurementUnit', while the string "1 kg" is 'Physical Quantity'.

Relations:

Bel

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_6c7160fc_cc64_46f0_b43b_aba65e9952e3

Definition: One bel is defined as ½ `ln(10) neper`.

Elucidation: Unit of measurement for quantities of type level or level difference.

Comment: Today decibel (one tenth of a bel) is commonly used instead of bel.

Comment: bel is used to express the ratio of one value of a power or field quantity to another, on a logarithmic scale, the logarithmic quantity being called the power level or field level, respectively.

Qudtentry: http://qudt.org/vocab/unit/B

Wikipediaentry: https://en.wikipedia.org/wiki/Decibel

SICoherentDerivedUnit

IRI: http://emmo.info/emmo/middle/siunits#EMMO_1273eb34_de48_43a9_925f_104110469dd2

Elucidation: A SI derived unit whos numerical factor in front of the product of SI base units is one.

Example: m/s kg/m^3

Comment: This class collects all units that are products or powers of SI base or SI special units only.

Relations:

- is_a metrology.DerivedUnit
- is_a siunits.SICoherentUnit

SINonCoherentDerivedUnit

IRI: http://emmo.info/emmo/middle/siunits#EMMO_60b78cc3_6011_4134_95ab_956f56d4bdc1

Elucidation: A derived unit whos numerical factor in front of the product of base units is NOT equal to one.

Relations:

- is_a siunits.SINonCoherentUnit

OffSystemUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_591e02fd_8d37_45a6_9d11_bb21cef391a0

Elucidation: A unit that does not belong to any system of units.

Example: eV barn

Relations:

- is_a metrology.MeasurementUnit

AstronomicalUnit

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_053648ea_3c0a_468c_89cb_eb009239323a

Definition: One astronomical unit is defined as exactly 149597870700 m, which is roughly the distance from earth to sun.

Dbpediaentry: http://dbpedia.org/page/Astronomical_unit

Qudtentry: http://qudt.org/vocab/unit/PARSEC

Wikipediaentry: https://en.wikipedia.org/wiki/Astronomical_unit

Relations:

- is_a units-extension.SIAcceptedSpecialUnit

- perceptual.hasSymbolData value “sr”

Minute

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_cabb20f0_05c7_448f_9485_e129725f15a4

Definition: Non-SI time unit defined as 60 seconds.

Dbpediaentry: http://dbpedia.org/page/Minute

Qudtentry: http://qudt.org/vocab/unit/MIN

Relations:

- is_a units-extension.SIAcceptedSpecialUnit
- is_a metrology.OffSystemUnit
- metrology.hasPhysicalDimension some isq.TimeDimension
- perceptual.hasSymbolData value “min”

SIPrefixedUnit

IRI: http://emmo.info/emmo/middle/siunits#EMMO_d41ce84b_4317_41fb_a5d1_6cd281fca106

Elucidation: A SI base or special unit with a metric prefix.

Comment: The presence of the prefix makes this units non-coherent with SI system.

Relations:

- is_a metrology.PrefixedUnit
- is_a siunits.SINonCoherentUnit

SINonCoherentUnit

IRI: http://emmo.info/emmo/middle/siunits#EMMO_8246541a_f1f6_4d03_8bd7_fc6b76d17375

Relations:

- disjoint_union_of siunits.SINonCoherentDerivedUnit, siunits.SIPrefixedUnit

AmountFractionUnit

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_f76f5a24_d703_4e8c_b368_f9a7777cb73a

Elucidation: Unit for quantities of dimension one that are the fraction of two amount of substance.

Example: Unit for amount fraction.

Relations:

- is_a units-extension.FractionUnit

SpecialUnit

IRI: http://emmo.info/emmo/middle/metrology#EMMO_3ee80521_3c23_4dd1_935d_9d522614a3e2

Elucidation: A unit symbol that stands for a derived unit.

Example: Pa stands for N/m2 J stands for N m

Comment: Special units are semiotic shortcuts to more complex composed symbolic objects.

Relations:

- is_a metrology.DerivedUnit
- is_a metrology.UnitSymbol
- is_a semiotics.Sign
- Inverse(semiotics.hasSign) some metrology.DerivedUnit

Neper

IRI: http://emmo.info/emmo/middle/units-extension#EMMO_b41515a9_28d8_4d78_8165_74b2fc72f89e

Definition: Unit of measurement for quantities of type level or level difference, which are defined as the natural logarithm of the ratio of power- or field-type quantities.

The value of a ratio in nepers is given by `ln(x1/x2)` where `x1` and `x2` are the values of interest (amplitudes), and ln is the natural logarithm. When the values are quadratic in the amplitude (e.g. power), they are first linearised by taking the square root before the logarithm is taken, or equivalently the result is halved.

Wikipedia

Dbpediaentry: http://dbpedia.org/page/Neper

Iupacentry: https://doi.org/10.1351/goldbook.N04106

Qudtentry: http://qudt.org/vocab/unit/NP

MeasuredQuantitativeProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_873b0ab3_88e6_4054_b901_5531e01f14a4

Relations:

- is_a metrology.QuantitativeProperty

QuantitativeProperty

IRI: http://emmo.info/emmo/middle/metrology#EMMO_dd4a7f3e_ef56_466c_ac1a_d2716b5f87ec

Definition: "A property of a phenomenon, body, or substance, where the property has a magnitude that can be expressed by means of a number and a reference" ISO 80000-1

"A reference can be a measurement unit, a measurement procedure, a reference material, or a combination of such." International vocabulary of metrology (VIM)

Elucidation: A 'Quantity' that can be quantified with respect to a standardized reference physical instance (e.g. the prototype meter bar, the kg prototype) or method (e.g. resilience) through a measurement process.

Comment: A quantitative property is always expresssed as a quantity (i.e. a number and a reference unit). For the EMMO, a nominalistic ontology, there is no property as abstract object.

A property is a sign that stands for an object according to a specific code shared by some observers.

For quantititative properties, one possible code that is shared between the scientific community (the observers) is the SI system of units.

Comment: Subclasses of 'QuantitativeProperty' classify objects according to the type semiosis that is used to connect the property to the object (e.g. by measurement, by convention, by modelling).

Relations:

- is_a metrology.Quantity
- is_a properties.ObjectiveProperty
- equivalent_to properties.MeasuredQuantitativeProperty or properties.ModelledQuantitativeProperty or properties.ConventionalQuantitativeProperty

ConventionalQuantitativeProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_d8aa8e1f_b650_416d_88a0_5118de945456

Elucidation: A quantitative property attributed by agreement to a quantity for a given purpose.

Example: The thermal conductivity of a copper sample in my laboratory can be assumed to be the conductivity that appears in the vendor specification. This value has been obtained by measurement of a sample which is not the one I have in my laboratory. This conductivity value is then a conventional quantitiative property assigned to my sample through a semiotic process in which no actual measurement is done by my laboratory.

If I don't believe the vendor, then I can measure the actual thermal conductivity. I then perform a measurement process that semiotically assign another value for the conductivity, which is a measured property, since is part of a measurement process.

Then I have two different physical quantities that are properties thanks to two different semiotic processes.

Comment: A property that is associated to an object by convention, or assumption.

Relations:

- is_a metrology.QuantitativeProperty

OrdinalQuantity

IRI: http://emmo.info/emmo/middle/metrology#EMMO_c46f091c_0420_4c1a_af30_0a2c8ebcf7d7

Elucidation: "Quantity, defined by a conventional measurement procedure, for which a total ordering relation can be established, according to magnitude, with other quantities of the same kind, but for which no algebraic operations among those quantities exist" International vocabulary of metrology (VIM)

Example: Hardness Resilience

Comment: "Ordinal quantities, such as Rockwell C hardness, are usually not considered to be part of a system of quantities because they are related to other quantities through empirical relations only." International vocabulary of metrology (VIM)

Relations:

- is_a metrology.Quantity

ModelledQuantitativeProperty

IRI: http://emmo.info/emmo/middle/properties#EMMO_d0200cf1_e4f4_45ae_873f_b9359daea3cd

Relations:

- is_a metrology.QuantitativeProperty

Quantity

IRI: http://emmo.info/emmo/middle/metrology#EMMO_f658c301_ce93_46cf_9639_4eace2c5d1d5

Elucidation: A symbolic that has parts a reference unit and a numerical object separated by a space expressing the value of a quantitative property (expressed as the product of the numerical and the unit).

Example: 6.8 m 0.9 km 8 K 6 MeV 43.5 HRC(150 kg)

Comment: A quantity is not necessarily a property, since it is possible to write "10 kg", without assigning this quantity to a specific object.

However, a quantitative property is always a quantity.

Comment: Referred as Quantity Value in International vocabulary of metrology (VIM)

Comment: SI distinguishes between a quantity (an abstract concept) and the quantity value (a number and a reference).

The EMMO, following strict nominalism, denies the existence of abstract objects and then collapses the two concepts of SI quantity and SI quantity value into a single one: the 'Quantity'.

So, for the EMMO the symbol "kg" is not a physical quantity but simply a 'Symbolic' object categorized as a 'MeasurementUnit'.

While the string "1 kg" is a 'Physical Quantity'.

Relations:

- is_a metrology.Metrological
- is_a reductionistic.State
- metrology.hasReferenceUnit exactly 1 metrology.ReferenceUnit
- metrology.hasQuantityValue exactly 1 math.Numerical
- disjoint_union_of metrology.PhysicalQuantity, metrology.OrdinalQuantity

PositionVector

IRI: http://emmo.info/emmo/middle/isq#EMMO_44da6d75_54a4_4aa8_bd3a_156f6e9abb8e

Definition: Vector r characterizing a point P in a point space with a given origin point O.

Iecentry: http://www.electropedia.org/iev/iev.nsf/display?openform&ievref=113-03-12

Altlabel: Position

Comment: In the usual geometrical three-dimensional space, position vectors are quantities of the dimension length.

– IEC

Comment: Position vectors are so-called bounded vectors, i.e. their magnitude and direction depend on the particular coordinate system used.

– ISO 80000-3

Physicaldimension: T0 L+1 M0 I0 Θ0 N0 J0

Relations:

- is_a isq.Length

Length

IRI: http://emmo.info/emmo/middle/isq#EMMO_cd2cd0de_e0cc_4ef1_b27e_2e88db027bac

Elucidation: Extend of a spatial dimension.

Iecentry: http://www.electropedia.org/iev/iev.nsf/display?openform&ievref=113-01-19

Comment: Length is a non-negative additive quantity attributed to a one-dimensional object in space.

Dbpediaentry: http://dbpedia.org/page/Length

Iupacentry: https://doi.org/10.1351/goldbook.L03498

AmountOfSubstance

IRI: http://emmo.info/emmo/middle/isq#EMMO_8159c26a_494b_4fa0_9959_10888f152298

Elucidation: The number of elementary entities present.

Comment: "In the name "amount of substance", the word "substance" will typically be replaced by words to specify the substance concerned in any particular application, for example "amount of hydrogen chloride, HCl", or "amount of benzene, C6H6". It is important to give a precise definition of the entity involved (as emphasized in the definition of the mole); this should preferably be done by specifying the molecular chemical formula of the material involved. Although the word "amount" has a more general dictionary definition, the abbreviation of the full name "amount of substance" to "amount" may be used for brevity."

– SI Brochure

AtomicMass

IRI: http://emmo.info/emmo/middle/isq#EMMO_27367073_ed8a_481a_9b07_f836dfe31f7f

Definition: The mass of an atom in the ground state.

Comment: Since the nucleus account for nearly all of the total mass of atoms (with the electrons and nuclear binding energy making minor contributions), the atomic mass measured in Da has nearly the same value as the mass number.

Comment: The atomic mass is often expressed as an average of the commonly found isotopes.

Iupacentry: https://doi.org/10.1351/goldbook.A00496

Physicaldimension: T0 L0 M+1 I0 Θ0 N0 J0

PureNumberQuantity

IRI: http://emmo.info/emmo/middle/isq#EMMO_ba882f34_0d71_4e4f_9d92_0c076c633a2c

Elucidation: A pure number, typically the number of something.

Example: 1, i, π, the number of protons in the nucleus of an atom

Comment: According to the SI brochure counting does not automatically qualify a quantity as an amount of substance.

This quantity is used only to describe the outcome of a counting process, without regard of the type of entities.

"There are also some quantities that cannot be described in terms of the seven base quantities of the SI, but have the nature of a count. Examples are a number of molecules, a number of cellular or biomolecular entities (for example copies of a particular nucleic acid sequence), or degeneracy in quantum mechanics. Counting quantities are also quantities with the associated unit one."

Stress

IRI: http://emmo.info/emmo/middle/isq#EMMO_d1917609_db5e_4b8a_9b76_ef1d6f860a81

Comment: Force per unit oriented surface area .

Comment: Measure of the internal forces that neighboring particles of a continuous material exert on each other.

Dbpediaentry: http://dbpedia.org/page/Stress_(mechanics)

Physicaldimension: T-2 L-1 M+1 I0 Θ0 N0 J0

Qudtentry: http://qudt.org/vocab/quantitykind/Stress

Relations:

- is_a isq.ISQDerivedQuantity

RatioQuantity

IRI: http://emmo.info/emmo/middle/isq#EMMO_faab3f84_e475_4a46_af9c_7d249f0b9aef

Elucidation: The class of quantities that are the ratio of two quantities with the same physical dimensionality.

Example: refractive index, volume fraction, fine structure constant

Comment: Quantities defined as ratios `Q=A/B` having equal dimensions in numerator and denominator are dimensionless quantities but still have a physical dimension defined as dim(A)/dim(B).

Johansson, Ingvar (2010). “Metrological thinking needs the notions of parametric quantities, units and dimensions”. Metrologia. 47 (3): 219–230. doi:10.1088/0026-1394/47/3/012. ISSN 0026-1394.

Physicaldimension: T0 L0 M0 I0 Θ0 N0 J0

Reductionistic branch

State

IRI: http://emmo.info/emmo/middle/reductionistic#EMMO_36c79456_e29c_400d_8bd3_0eedddb82652

Elucidation: A 'Physical' which is a tessellation of spatial direct parts.

Example: e.g. the existent in my glass is declared at t = t_start as made of two direct parts: the ice and the water. It will continue to exists as state as long as the ice is completely melt at t = t_end. The new state will be completely made of water. Between t_start and t_end there is an exchange of molecules between the ice and the water, but this does not affect the existence of the two states.

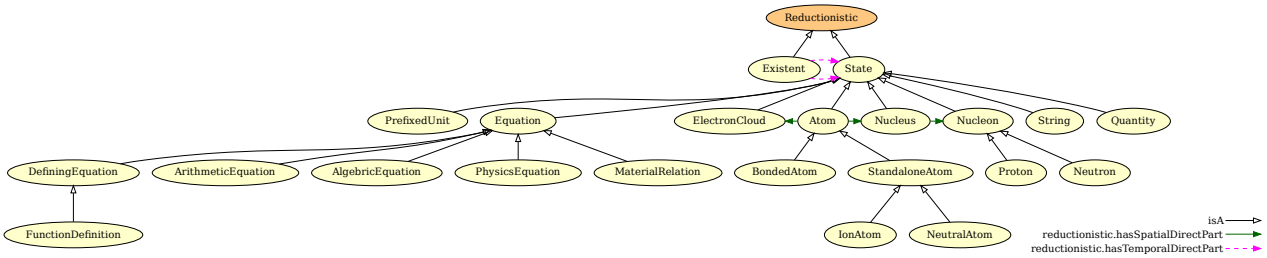

Figure 3.35: Reductionistic branch.

If we partition the existent in my glass as ice surrounded by several molecules (we do not use the object water as direct part) then the appearance of a molecule coming from the ice will cause a state to end and another state to begin.

Comment: Direct partitions declaration is a choice of the ontologist that choses the classes to be used as direct parts, according to its own world view.

A 'State' can always be direct partitioned in 'Elementary'-s and 'Void' or 'Physical'.

e.g. the water in my glass can be seen as a single object without declaring direct parts, or as made of H2O molecules direct parts.

Comment: The definition of 'State' implies that its spatial direct parts (i.e. 'physicals') are not gained or lost during its temporal extension (they exist from the left to the right side of the time interval), so that the cardinality of spatial direct parts in a 'State' is constant.

This does not mean that there cannot be a change in the internal structure of the 'State' direct parts. It means only that this change must not affect the existence of the direct part itself.

There is no change in granularity or cardinality of direct parts of a 'State'.

The use of spatial direct parthood in 'State' definition means that a 'State' cannot overlap in space another 'State'.

Comment: The usefulness of 'State' is that it makes it possible to describe the evolution in time of an 'Existent' in terms of series of 'State'-s that can take into account the disappearance or appearance of parts within a 'Physical'.

A 'State' is a recognizable granularity level of matter, in the sense that its direct parts do not appear or disappear within its lifetime as it can be for a generic 'Existent'.

Comment: There is no change in granularity or cardinality of parts within a state.

The use of spatial direct parthood in state definition means that a state cannot overlap in space another state that is direct part of the same whole.

Relations:

- is_a reductionistic.Reductionistic
- reductionistic.hasSpatialDirectPart some physical.Physical

Equation

IRI: http://emmo.info/emmo/middle/math#EMMO_e56ee3eb_7609_4ae1_8bed_51974f0960a6

Elucidation: The class of 'mathematical'-s that stand for a statement of equality between two mathematical expressions.

Example: 2+3 = 5 x^2 +3x = 5x dv/dt = a sin(x) = y

Comment: An equation with variables can always be represented as:

f(v0, v1, ..., vn) = g(v0, v1, ..., vn)

where f is the left hand and g the right hand side expressions and v0, v1, ..., vn are the variables.

Relations:

- is_a math.MathematicalFormula
- is_a reductionistic.State
- is_a math.Mathematical
- reductionistic.hasSpatialDirectPart some math.Expression

ElectronCloud

IRI: http://emmo.info/emmo/middle/materials#EMMO_1067b97a_84f8_4d22_8ace_b842b8ce355c

Elucidation: A 'spacetime' that stands for a quantum system made of electrons.

Relations:

- is_a materials.Subatomic
- is_a reductionistic.State
- reductionistic.hasSpatialDirectPart some physicalistic.Electron

Reductionistic

IRI: http://emmo.info/emmo/middle/reductionistic#EMMO_15db234d_ecaf_4715_9838_4b4ec424fb13

Elucidation: A class devoted to categorize 'Physical'-s according to their granularity relations, first in terms of time evolution (Existent) and then in terms of their composition (State), up to the spatial a-tomistic element (Elementary).

Comment: Direct parthood is the relation used to build the class hierarchy (and the granularity hierarchy) for this perspective.

Relations:

- is_a top.Perspective
- equivalent_to reductionistic.State or reductionistic.Existent

Nucleon

IRI: http://emmo.info/emmo/middle/materials#EMMO_50781fd9_a9e4_46ad_b7be_4500371d188d

Relations:

- is_a materials.Subatomic
- is_a reductionistic.State
- reductionistic.hasSpatialDirectPart some physicalistic.Quark
- disjoint_union_of materials.Proton, materials.Neutron

DefiningEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_29afdf54_90ae_4c98_8845_fa9ea3f143a8

Elucidation: An equation that define a new variable in terms of other mathematical entities.

Example: The definition of velocity as v = dx/dt.

The definition of density as mass/volume.

y = f(x)

Relations:

- is_a math.Equation

IonAtom

IRI: http://emmo.info/emmo/middle/materials#EMMO_db03061b_db31_4132_a47a_6a634846578b

Elucidation: A standalone atom with an unbalanced number of electrons with respect to its atomic number.

Comment: The ion_atom is the basic part of a pure ionic bonded compound i.e. without eclectron sharing,

Relations:

- is_a materials.StandaloneAtom

NeutralAtom

IRI: http://emmo.info/emmo/middle/materials#EMMO_4588526f_8553_4f4d_aa73_a483e88d599b

Elucidation: A standalone atom that has no net charge.

Relations:

- is_a materials.StandaloneAtom

BondedAtom

IRI: http://emmo.info/emmo/middle/materials#EMMO_8303a247_f9d9_4616_bdcd_f5cbd7b298e3

Elucidation: An bonded atom that shares at least one electron to the atom-based entity of which is part of.

Comment: A real bond between atoms is always something hybrid between covalent, metallic and ionic.

In general, metallic and ionic bonds have atoms sharing electrons.

Comment: The bond types that are covered by this definition are the strong electonic bonds: covalent, metallic and ionic.

Comment: This class can be used to represent molecules as simplified quantum systems, in which outer molecule shared electrons are un-entangled with the inner shells of the atoms composing the molecule.

Relations:

- is_a materials.Atom

String

IRI: http://emmo.info/emmo/middle/perceptual#EMMO_50ea1ec5_f157_41b0_b46b_a9032f17ca10

Elucidation: A physical made of more than one symbol sequentially arranged.

Example: The word “cat” considered as a collection of ‘symbol’-s respecting the rules of english language.

In this example the ‘symbolic’ entity “cat” is not related to the real cat, but it is only a word (like it would be to an italian person that ignores the meaning of this english word).

If an ‘interpreter’ skilled in english language is involved in a ‘semiotic’ process with this word, that “cat” became also a ‘sign’ i.e. it became for the ‘interpreter’ a representation for a real cat.

Comment: A string is made of concatenated symbols whose arrangement is one-dimensional. Each symbol can have only one previous and one next neighborhood (bidirectional list).

Comment: A string is not requested to respect any syntactic rule: it’s simply directly made of symbols.

Relations:

- is_a perceptual.SymbolicComposition
- is_a reductionistic.State
- reductionistic.hasSpatialDirectPart some perceptual.Symbol
- reductionistic.hasSpatialDirectPart only perceptual.Symbol

ArithmeticEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_a6138ba7_e365_4f2d_b6b4_fe5a5918d403

Example: $1 + 1 = 2$

Relations:

- is_a math.Equation

StandaloneAtom

IRI: http://emmo.info/emmo/middle/materials#EMMO_2fd3f574_5e93_47fe_afca_ed80b0a21ab4

Elucidation: An atom that does not share electrons with other atoms.

Comment: A standalone atom can be bonded with other atoms by intermolecular forces (i.e. dipole–dipole, London dispersion force, hydrogen bonding), since this bonds does not involve electron sharing.

Relations:

- is_a materials.Atom
- disjoint_union_of materials.NeutralAtom, materials.IonAtom

Atom

IRI: http://emmo.info/emmo/middle/materials#EMMO_eb77076b_a104_42ac_a065_798b2d2809ad

Elucidation: A standalone atom has direct part one 'nucleus' and one 'electron_cloud'.

An O 'atom' within an O2 'molecule' is an 'e-bonded_atom'.

In this material branch, H atom is a particular case, with respect to higher atomic number atoms, since as soon as it shares its electron it has no nucleus entangled electron cloud.

We cannot say that H2 molecule has direct part two H atoms, but has direct part two H nucleus.

Comment: An 'atom' is a 'nucleus' surrounded by an 'electron_cloud', i.e. a quantum system made of one or more bounded electrons.

Relations:

- is_a physicalistic.Matter
- is_a reductionistic.State
- reductionistic.hasSpatialDirectPart some materials.ElectronCloud
- reductionistic.hasSpatialDirectPart some materials.Nucleus

AlgebricEquation

IRI: http://emmo.info/emmo/middle/math#EMMO_98d65021_4574_4890_b2fb_46430841077f

Example: 2 * a - b = c

Comment: An 'equation' that has parts two 'polynomial'-s

Relations:

- is_a math.Equation
- reductionistic.hasSpatialDirectPart some math.AlgebricExpression

Nucleus

PhysicsEquation

IRI: http://emmo.info/emmo/middle/models#EMMO_27c5d8c6_8af7_4d63_beb1_ec37cd8b3fa3

Elucidation: An 'equation' that stands for a 'physical_law' by mathematically defining the relations between physics_quantities.

Example: The Newton's equation of motion.

The Schrödinger equation.

The Navier-Stokes equation.

Relations:

- is_a math.Equation
- is_a models.MathematicalModel
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity
- Inverse(models.hasModel) some models.PhysicalPhenomenon

MaterialRelation

IRI: http://emmo.info/emmo/middle/models#EMMO_e5438930_04e7_4d42_ade5_3700d4a52ab7

Elucidation: An 'equation' that stands for a physical assumption specific to a material, and provides an expression for a 'physics_quantity' (the dependent variable) as function of other variables, physics_quantity or data (independent variables).

Example: The Lennard-Jones potential.

A force field.

An Hamiltonian.

Comment: A material_relation can e.g. return a predefined number, return a database query, be an equation that depends on other physics_quantities.

Relations:

- is_a math.Equation
- reductionistic.hasSpatialDirectPart some metrology.PhysicalQuantity

Neutron

Existent

IRI: http://emmo.info/emmo/middle/reductionistic#EMMO_52211e5e_d767_4812_845e_eb6b402c476a

Elucidation: A 'Physical' which is a tessellation of 'State' temporal direct parts.

Comment: 'Existent' is the EMMO class to be used for representing real world physical objects under a reductionistic perspective (i.e. objects come from the composition of sub-part objects, both in time and space).

'Existent' class collects all individuals that stand for physical objects that can be structured in well defined temporal sub-parts called states, through the temporal direct parthood relation.

This class provides a first granularity hierarchy in time, and a way to axiomatize tessellation principles for a specific whole with a non-transitivity relation (direct parthood) that helps to retain the granularity levels.

e.g. a car, a supersaturated gas with nucleating nanoparticles, an atom that becomes ionized and then recombines with an electron.

Comment: An 'Existent' individual stands for a real world object for which the ontologist wants to provide univocal tessellation in time.

By definition, the tiles are represented by 'State'-s individual.

Tiles are related to the 'Existent' through temporal direct parthood, enforcing non-transitivity and inverse-functionality.

Comment: Being hasTemporalDirectPart a proper parthood relation, there cannot be 'Existent' made of a single 'State'.

Moreover, due to inverse functionality, a 'State' can be part of only one 'Existent', preventing overlapping between 'Existent'-s.

Comment: ex-sistere (latin): to stay (to persist through time) outside others of the same type (to be distinct from the rest).

Relations:

- is_a reductionistic.Reductionistic
- reductionistic.hasTemporalDirectPart some reductionistic.State
- reductionistic.hasTemporalDirectPart only reductionistic.State

FunctionDefinition

IRI: http://emmo.info/emmo/middle/math#EMMO_4bc29b0f_8fcc_4026_a291_f9774a66d9b8

Elucidation: A function defined using functional notation.

Example: y = f(x)

Relations:

- is_a math.DefiningEquation

Expression branch

Matter branch

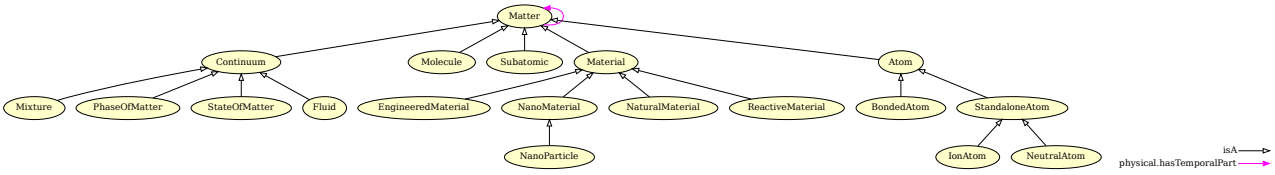

Figure 3.40: Matter branch.

PhaseOfMatter

IRI: http://emmo.info/emmo/middle/materials#EMMO_668fbd5b_6f1b_405c_9c6b_d6067bd0595a

Elucidation: A matter object throughout which all physical properties of a material are essentially uniform.

Comment: In the physical sciences, a phase is a region of space (a thermodynamic system), throughout which all physical properties of a material are essentially uniform. Examples of physical properties include density, index of refraction, magnetization and chemical composition. A simple description is that a phase is a region of material that is chemically uniform, physically distinct, and (often) mechanically separable. In a system consisting of ice and water in a glass jar, the ice cubes are one phase, the water is a second phase, and the humid air is a third phase over the ice and water. The glass of the jar is another separate phase.

The term phase is sometimes used as a synonym for state of matter, but there can be several immiscible phases of the same state of matter. Also, the term phase is sometimes used to refer to a set of equilibrium states demarcated in terms of state variables such as pressure and temperature by a phase boundary on a phase diagram. Because phase boundaries relate to changes in the organization of matter, such as a change from liquid to solid or a more subtle change from one crystal structure to another, this latter usage is similar to the use of “phase” as a synonym for state of matter. However, the state of matter and phase diagram usages are not commensurate with the formal definition given above and the intended meaning must be determined in part from the context in which the term is used.

Relations:

- is_a physicalistic.Material

Molecule

IRI: http://emmo.info/emmo/middle/materials#EMMO_3397f270_dfc1_4500_8f6f_4d0d85ac5f71

Elucidation: An atom_based state defined by an exact number of e-bonded atomic species and an electron cloud made of the shared electrons.

Example: H20, C6H12O6, CH4

Comment: An entity is called essential if removing one direct part will lead to a change in entity class.

An entity is called redundand if removing one direct part will not lead to a change in entity class.

Comment: This definition states that this object is a non-periodic set of atoms or a set with a finite periodicity.

Removing an atom from the state will result in another type of atom_based state.

e.g. you cannot remove H from H20 without changing the molecule type (essential). However, you can remove a C from a nanotube (redundant). C60 fullerene is a molecule, since it has a finite periodicity and is made of a well defined number of atoms (essential). A C nanotube is not a molecule, since it has an infinite periodicity (redundant).

Relations:

- is_a physicalistic.Matter

StandaloneAtom

IRI: http://emmo.info/emmo/middle/materials#EMMO_2fd3f574_5e93_47fe_afca_ed80b0a21ab4

Elucidation: An atom that does not share electrons with other atoms.

Comment: A standalone atom can be bonded with other atoms by intermolecular forces (i.e. dipole–dipole, London dispersion force, hydrogen bonding), since this bonds does not involve electron sharing.

Relations:

Continuum

IRI: http://emmo.info/emmo/middle/materials#EMMO_8b0923ab_b500_477b_9ce9_8b3a3e4dc4f2

Elucidation: A state that is a collection of sufficiently large number of other parts such that: - it is the bearer of qualities that can exists only by the fact that it is a sum of parts - the smallest partition dV of the state volume in which we are interested in, contains enough parts to be statistically consistent: n [#/m3] x dV [m3] >> 1

Comment: A continuum is made of a sufficient number of parts that it continues to exists as continuum individual even after the loss of one of them i.e. a continuum is a redundant.

Comment: A continuum is not necessarily small (i.e. composed by the minimum amount of sates to fulfill the definition).

A single continuum individual can be the whole fluid in a pipe.

Comment: A continuum is the bearer of properties that are generated by the interactions of parts such as viscosity and thermal or electrical conductivity.

Relations:

- is_a physicalistic.Matter

Fluid branch

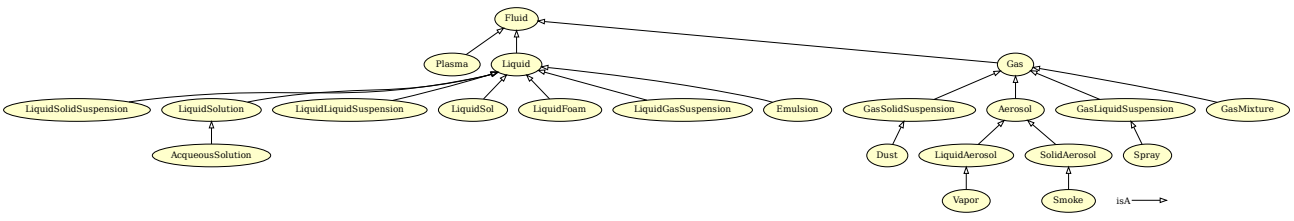

Figure 3.41: Fluid branch.

Gas

IRI: http://emmo.info/emmo/middle/materials#EMMO_04f2a2d5_e799_4692_a654_420e76f5acc1

Elucidation: Gas is a compressible fluid, a state of matter that has no fixed shape and no fixed volume.

Relations:

- is_a materials.Fluid
- is_a materials.StateOfMatter

LiquidSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_e9e02156_651f_41c8_9efb_d5da0d4ce5e2

Elucidation: A coarse dispersion of solids in a liquid continuum phase.

Example: Mud

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

Vapor

IRI: http://emmo.info/emmo/middle/materials#EMMO_4d604a13_d1f6_42fd_818f_d3138d5e308c

Elucidation: A liquid aerosol composed of water droplets in air or another gas.

Relations:

- is_a materials.LiquidAerosol

GasSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_d4f37e32_16ae_4cc6_b4cd_fd896b2449c4

Elucidation: A coarse dispersion of solid in a gas continuum phase.

Example: Dust, sand storm.

Relations:

- is_a materials.Gas
- is_a materials.Suspension

Fluid

IRI: http://emmo.info/emmo/middle/materials#EMMO_87ac88ff_8379_4f5a_8c7b_424a8fff1ee8

Elucidation: A continuum that has no fixed shape and yields easily to external pressure.

Example: Gas, liquid, plasma,

Relations:

- is_a materials.Continuum

LiquidAerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_94010cbc_c2a6_4cb9_b29a_83aa99d2ff70

Elucidation: An aerosol composed of liquid droplets in air or another gas.

Relations:

- is_a materials.Aerosol

LiquidSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_4b3e2374_52a1_4420_8e3f_3ae6b9bf7dff

Elucidation: A liquid solution made of two or more component substances.

Relations:

- is_a materials.Solution
- is_a materials.Liquid

Aerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_560d833a_6184_410c_859a_05d982712fd7

Elucidation: A colloid composed of fine solid particles or liquid droplets in air or another gas.

Relations:

- is_a materials.Gas
- is_a materials.Colloid

LiquidLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_47fe2379_be21_48d1_9ede_402f0faf494b

Elucidation: A coarse dispersion of liquid in a liquid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

Spray

IRI: http://emmo.info/emmo/middle/materials#EMMO_498aad49_f8d4_40a4_a9eb_efd563a0115f

Elucidation: A suspension of liquid droplets dispersed in a gas through an atomization process.

Relations:

- is_a materials.GasLiquidSuspension

Dust

IRI: http://emmo.info/emmo/middle/materials#EMMO_e4281979_2b07_4a43_a772_4903fb3696fe

Elucidation: A suspension of fine particles in the atmosphere.

Relations:

- is_a materials.GasSolidSuspension

Plasma

IRI: http://emmo.info/emmo/middle/materials#EMMO_4c21fb86_fdcf_444e_b498_86fe656295af

Elucidation: A fluid in which a gas is ionized to a level where its electrical conductivity allows long-range electric and magnetic fields to dominate its behaviour.

Relations:

- is_a materials.Fluid
- is_a materials.StateOfMatter

LiquidSol

IRI: http://emmo.info/emmo/middle/materials#EMMO_4354ac74_7425_43ab_92e4_6dc19d1afee9

Elucidation: A type of sol in the form of one solid dispersed in liquid.

Relations:

- is_a materials.Sol
- is_a materials.Liquid

GasLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_e0edfb9e_9a96_4fae_b942_831ffe27b84a

Elucidation: A coarse dispersion of liquid in a gas continuum phase.

Example: Rain, spray.

Relations:

- is_a materials.Gas
- is_a materials.Suspension

LiquidFoam

IRI: http://emmo.info/emmo/middle/materials#EMMO_d69d2e95_b22f_499a_a552_17fde0d778fc

Elucidation: A foam of trapped gas in a liquid.

Relations:

- is_a materials.Foam
- is_a materials.Liquid

LiquidGasSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_42185fe7_122c_4e0c_a3cd_659d3e21c389

Elucidation: A coarse dispersion of gas in a liquid continuum phase.

Example: Sparkling water

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

Emulsion

IRI: http://emmo.info/emmo/middle/materials#EMMO_40e18c93_a1b5_49ff_b06a_d9d932d1fb65

Elucidation: An emulsion is a mixture of two or more liquids that are normally immiscible (a liquid-liquid heterogeneous mixture).

Example: Mayonnaise, milk.

Relations:

- is_a materials.Colloid
- is_a materials.Liquid

Liquid

IRI: http://emmo.info/emmo/middle/materials#EMMO_7509da43_56b1_4d7f_887a_65d1663df4ba

Elucidation: A liquid is a nearly incompressible fluid that conforms to the shape of its container but retains a (nearly) constant volume independent of pressure.

Relations:

- is_a materials.Fluid

- is_a materials.StateOfMatter

Smoke

IRI: http://emmo.info/emmo/middle/materials#EMMO_5a2af26d_99de_4e5e_b1cd_514be71420c3

Elucidation: Smoke is a solid aerosol made of particles emitted when a material undergoes combustion or pyrolysis.

Relations:

- is_a materials.SolidAerosol

AcqueousSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_5cb107ba_7daa_46dd_8f9f_da22a6eac676

Elucidation: A liquid solution in which the solvent is water.

Relations:

- is_a materials.LiquidSolution

GasMixture

IRI: http://emmo.info/emmo/middle/materials#EMMO_5be9c137_325a_43d8_b7cd_ea93e7721c2d

Elucidation: A gaseous solution made of more than one component type.

Relations:

- is_a materials.Gas
- is_a materials.Solution

SolidAerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_96c8d72f_b436_44e2_9f7f_085c24094292

Elucidation: An aerosol composed of fine solid particles in air or another gas.

Relations:

- is_a materials.Aerosol

Mixture branch

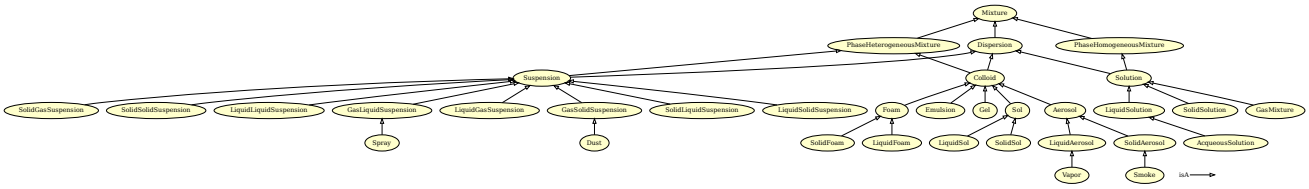

Figure 3.42: Mixture branch.

Mixture

IRI: http://emmo.info/emmo/middle/materials#EMMO_ec2c8ac8_98c5_4c74_b85b_ff8e8ca6655c

Elucidation: A Miixture is a material made up of two or more different substances which are physically (not chemically) combined.

Relations:

- is_a materials.Continuum

Sol

IRI: http://emmo.info/emmo/middle/materials#EMMO_31557fae_b039_491c_bcbb_0ccb8711d5a6

Elucidation: A colloid in which small particles (1 nm to 100 nm) are suspended in a continuum phase.

Relations:

- is_a materials.Colloid

Vapor

IRI: http://emmo.info/emmo/middle/materials#EMMO_4d604a13_d1f6_42fd_818f_d3138d5e308c

Elucidation: A liquid aerosol composed of water droplets in air or another gas.

Relations:

- is_a materials.LiquidAerosol

GasSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_d4f37e32_16ae_4cc6_b4cd_fd896b2449c4

Elucidation: A coarse dispersion of solid in a gas continuum phase.

Example: Dust, sand storm.

Relations:

- is_a materials.Gas
- is_a materials.Suspension

LiquidSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_4b3e2374_52a1_4420_8e3f_3ae6b9bf7dff

Elucidation: A liquid solution made of two or more component substances.

Relations:

- is_a materials.Solution
- is_a materials.Liquid

Suspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_4a464c8d_8895_44a8_a628_aed13509f1bd

Elucidation: An heterogeneous mixture that contains coarsly dispersed particles (no Tyndall effect), that generally tend to separate in time to the dispersion medium phase.

Comment: Suspensions show no significant effect on light.

Relations:

- is_a materials.Dispersion
- is_a materials.PhaseHeterogeneousMixture
- is_a materials.StateOfMatter
- disjoint_union_of materials.SolidSolidSuspension, materials.SolidLiquidSuspension, materials.LiquidGasSuspension, materials.LiquidLiquidSuspension, materials.SolidGasSuspension, materials.GasSolidSuspension, materials.GasLiquidSuspension, materials.LiquidSolidSuspension

Aerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_560d833a_6184_410c_859a_05d982712fd7

Elucidation: A colloid composed of fine solid particles or liquid droplets in air or another gas.

Relations:

- is_a materials.Gas
- is_a materials.Colloid

Spray

IRI: http://emmo.info/emmo/middle/materials#EMMO_498aad49_f8d4_40a4_a9eb_efd563a0115f

Elucidation: A suspension of liquid droplets dispersed in a gas through an atomization process.

Relations:

- is_a materials.GasLiquidSuspension

Dust

IRI: http://emmo.info/emmo/middle/materials#EMMO_e4281979_2b07_4a43_a772_4903fb3696fe

Elucidation: A suspension of fine particles in the atmosphere.

Relations:

- is_a materials.GasSolidSuspension

Solution

IRI: http://emmo.info/emmo/middle/materials#EMMO_2031516a_2be7_48e8_9af7_7e1270e308fe

Elucidation: A solution is a homogeneous mixture composed of two or more substances.

Comment: Solutions are characterized by the occurrence of Rayleigh scattering on light,

Relations:

- is_a materials.Dispersion
- is_a materials.PhaseHomogeneousMixture

LiquidSol

IRI: http://emmo.info/emmo/middle/materials#EMMO_4354ac74_7425_43ab_92e4_6dc19d1afee9

Elucidation: A type of sol in the form of one solid dispersed in liquid.

Relations:

- is_a materials.Sol
- is_a materials.Liquid

SolidFoam

IRI: http://emmo.info/emmo/middle/materials#EMMO_9bed5d66_805a_4b3a_9153_beaf67143848

Elucidation: A foam of trapped gas in a solid.

Example: Aerogel

Relations:

- is_a materials.Foam
- is_a materials.Solid

Dispersion

IRI: http://emmo.info/emmo/middle/materials#EMMO_0b15f4ae_092e_4487_9100_3c44176c545c

Elucidation: A material in which distributed particles of one phase are dispersed in a different continuous phase.

Relations:

- is_a materials.Mixture
- disjoint_union_of materials.Solution, materials.Suspension, materials.Colloid

SolidSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_5e77f00d_5c0a_44e7_baf1_2c2a4cb5b3ae

Elucidation: A solid solution made of two or more component substances.

Relations:

- is_a materials.Solution
- is_a materials.Solid

Smoke

IRI: http://emmo.info/emmo/middle/materials#EMMO_5a2af26d_99de_4e5e_b1cd_514be71420c3

Elucidation: Smoke is a solid aerosol made of particles emitted when a material undergoes combustion or pyrolysis.

Relations:

- is_a materials.SolidAerosol

GasMixture

IRI: http://emmo.info/emmo/middle/materials#EMMO_5be9c137_325a_43d8_b7cd_ea93e7721c2d

Elucidation: A gaseous solution made of more than one component type.

Relations:

- is_a materials.Gas
- is_a materials.Solution

SolidLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_33e0ac8b_a318_4285_b1de_e95347784632

Elucidation: A coarse dispersion of liquid in a solid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Solid

LiquidSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_e9e02156_651f_41c8_9efb_d5da0d4ce5e2

Elucidation: A coarse dispersion of solids in a liquid continuum phase.

Example: Mud

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

Colloid

IRI: http://emmo.info/emmo/middle/materials#EMMO_6c487fb3_03d1_4e56_91ed_c2e16dcbef60

Elucidation: A mixture in which one substance of microscopically dispersed insoluble or soluble particles (from 1 nm to 1 μm) is suspended throughout another substance and that does not settle, or would take a very long time to settle appreciably.

Comment: Colloids are characterized by the occurring of the Tyndall effect on light.

Relations:

- is_a materials.Dispersion
- is_a materials.PhaseHeterogeneousMixture

LiquidAerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_94010cbc_c2a6_4cb9_b29a_83aa99d2ff70

Elucidation: An aerosol composed of liquid droplets in air or another gas.

Relations:

- is_a materials.Aerosol

SolidGasSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_c457b6b9_5e73_4853_ae08_d776c12b8058

Elucidation: A coarse dispersion of gas in a solid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Solid

SolidSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_2dd512a1_5187_47cc_b0b8_141214e22b59

Elucidation: A coarse dispersion of solid in a solid continuum phase.

Example: Granite, sand, dried concrete.

Relations:

- is_a materials.Suspension
- is_a materials.Solid

LiquidLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_47fe2379_be21_48d1_9ede_402f0faf494b

Elucidation: A coarse dispersion of liquid in a liquid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

PhaseHeterogeneousMixture

IRI: http://emmo.info/emmo/middle/materials#EMMO_0e030040_98a7_49b2_a871_dced1f3a6131

Elucidation: A mixture in which more than one phases of matter cohexists.

Comment: Phase heterogenous mixture may share the same state of matter.

For example, immiscibile liquid phases (e.g. oil and water) constitute a mixture whose phases are clearly separated but share the same state of matter.

Relations:

- is_a materials.Mixture
- mereotopology.hasProperPart some materials.PhaseOfMatter

GasLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_e0edfb9e_9a96_4fae_b942_831ffe27b84a

Elucidation: A coarse dispersion of liquid in a gas continuum phase.

Example: Rain, spray.

Relations:

- is_a materials.Gas
- is_a materials.Suspension

LiquidFoam

IRI: http://emmo.info/emmo/middle/materials#EMMO_d69d2e95_b22f_499a_a552_17fde0d778fc

Elucidation: A foam of trapped gas in a liquid.

Relations:

- is_a materials.Foam
- is_a materials.Liquid

Foam

IRI: http://emmo.info/emmo/middle/materials#EMMO_1f5e3e7e_72c9_40d4_91dd_ae432d7b7018

Elucidation: A colloid formed by trapping pockets of gas in a liquid or solid.

Relations:

- is_a materials.Colloid

LiquidGasSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_42185fe7_122c_4e0c_a3cd_659d3e21c389

Elucidation: A coarse dispersion of gas in a liquid continuum phase.

Example: Sparkling water

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

PhaseHomogeneousMixture

IRI: http://emmo.info/emmo/middle/materials#EMMO_0e6378df_1ce8_4321_b00c_ee9beea60a67

Elucidation: A single phase mixture.

Relations:

- is_a materials.Mixture

Emulsion

IRI: http://emmo.info/emmo/middle/materials#EMMO_40e18c93_a1b5_49ff_b06a_d9d932d1fb65

Elucidation: An emulsion is a mixture of two or more liquids that are normally immiscible (a liquid-liquid heterogeneous mixture).

Example: Mayonnaise, milk.

Relations:

- is_a materials.Colloid
- is_a materials.Liquid

Gel

IRI: http://emmo.info/emmo/middle/materials#EMMO_3995e22d_5720_4dcf_ba3b_d0ce03f514c6

Elucidation: A soft, solid or solid-like colloid consisting of two or more components, one of which is a liquid, present in substantial quantity.

Relations:

- is_a materials.Colloid
- is_a materials.Solid

AcqueousSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_5cb107ba_7daa_46dd_8f9f_da22a6eac676

Elucidation: A liquid solution in which the solvent is water.

Relations:

- is_a materials.LiquidSolution

SolidSol

IRI: http://emmo.info/emmo/middle/materials#EMMO_5add9885_dc98_4fa5_8482_fdf9ba5e3889

Elucidation: A type of sol in the form of one solid dispersed in another continuous solid.

Relations:

- is_a materials.Sol
- is_a materials.Solid

SolidAerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_96c8d72f_b436_44e2_9f7f_085c24094292

Elucidation: An aerosol composed of fine solid particles in air or another gas.

Relations:

- is_a materials.Aerosol

State Of Matter branch

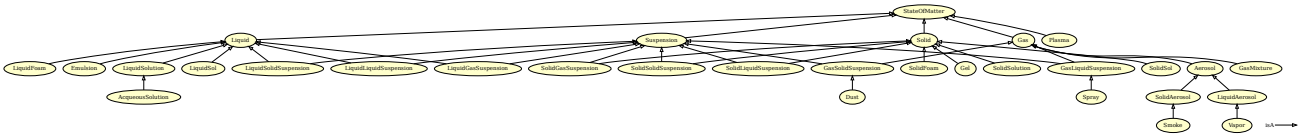

Figure 3.43: State Of Matter branch.

Gas

IRI: http://emmo.info/emmo/middle/materials#EMMO_04f2a2d5_e799_4692_a654_420e76f5acc1

Elucidation: Gas is a compressible fluid, a state of matter that has no fixed shape and no fixed volume.

Relations:

- is_a materials.Fluid
- is_a materials.StateOfMatter

LiquidSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_e9e02156_651f_41c8_9efb_d5da0d4ce5e2

Elucidation: A coarse dispersion of solids in a liquid continuum phase.

Example: Mud

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

StateOfMatter

IRI: http://emmo.info/emmo/middle/materials#EMMO_b9695e87_8261_412e_83cd_a86459426a28

Elucidation: A superclass made as the disjoint union of all the form under which matter can exist.

Comment: In physics, a state of matter is one of the distinct forms in which matter can exist. Four states of matter are observable in everyday life: solid, liquid, gas, and plasma.

https://en.wikipedia.org/wiki/State_of_matter

Relations:

- is_a materials.Continuum
- is_a physicalistic.Matter

SolidGasSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_c457b6b9_5e73_4853_ae08_d776c12b8058

Elucidation: A coarse dispersion of gas in a solid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Solid

LiquidSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_4b3e2374_52a1_4420_8e3f_3ae6b9bf7dff

Elucidation: A liquid solution made of two or more component substances.

Relations:

- is_a materials.Solution
- is_a materials.Liquid

Aerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_560d833a_6184_410c_859a_05d982712fd7

Elucidation: A colloid composed of fine solid particles or liquid droplets in air or another gas.

Relations:

- is_a materials.Gas
- is_a materials.Colloid

SolidSolidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_2dd512a1_5187_47cc_b0b8_141214e22b59

Elucidation: A coarse dispersion of solid in a solid continuum phase.

Example: Granite, sand, dried concrete.

Relations:

- is_a materials.Suspension
- is_a materials.Solid

Spray

IRI: http://emmo.info/emmo/middle/materials#EMMO_498aad49_f8d4_40a4_a9eb_efd563a0115f

Elucidation: A suspension of liquid droplets dispersed in a gas through an atomization process.

Relations:

- is_a materials.GasLiquidSuspension

LiquidLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_47fe2379_be21_48d1_9ede_402f0faf494b

Elucidation: A coarse dispersion of liquid in a liquid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

Dust

IRI: http://emmo.info/emmo/middle/materials#EMMO_e4281979_2b07_4a43_a772_4903fb3696fe

Elucidation: A suspension of fine particles in the atmosphere.

Relations:

- is_a materials.GasSolidSuspension

Solid

IRI: http://emmo.info/emmo/middle/materials#EMMO_a2b006f2_bbfd_4dba_bcaa_3fca20cd6be1

Elucidation: A continuum characterized by structural rigidity and resistance to changes of shape or volume, that retains its shape and density when not confined.

Relations:

- is_a materials.StateOfMatter
- is_a materials.Continuum

LiquidSol

IRI: http://emmo.info/emmo/middle/materials#EMMO_4354ac74_7425_43ab_92e4_6dc19d1afee9

Elucidation: A type of sol in the form of one solid dispersed in liquid.

Relations:

- is_a materials.Sol
- is_a materials.Liquid

GasLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_e0edfb9e_9a96_4fae_b942_831ffe27b84a

Elucidation: A coarse dispersion of liquid in a gas continuum phase.

Example: Rain, spray.

Relations:

- is_a materials.Gas
- is_a materials.Suspension

Plasma

IRI: http://emmo.info/emmo/middle/materials#EMMO_4c21fb86_fdcf_444e_b498_86fe656295af

Elucidation: A fluid in which a gas is ionized to a level where its electrical conductivity allows long-range electric and magnetic fields to dominate its behaviour.

Relations:

- is_a materials.Fluid
- is_a materials.StateOfMatter

LiquidFoam

IRI: http://emmo.info/emmo/middle/materials#EMMO_d69d2e95_b22f_499a_a552_17fde0d778fc

Elucidation: A foam of trapped gas in a liquid.

Relations:

- is_a materials.Foam
- is_a materials.Liquid

LiquidGasSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_42185fe7_122c_4e0c_a3cd_659d3e21c389

Elucidation: A coarse dispersion of gas in a liquid continuum phase.

Example: Sparkling water

Relations:

- is_a materials.Suspension
- is_a materials.Liquid

SolidLiquidSuspension

IRI: http://emmo.info/emmo/middle/materials#EMMO_33e0ac8b_a318_4285_b1de_e95347784632

Elucidation: A coarse dispersion of liquid in a solid continuum phase.

Relations:

- is_a materials.Suspension
- is_a materials.Solid

SolidFoam

IRI: http://emmo.info/emmo/middle/materials#EMMO_9bed5d66_805a_4b3a_9153_beaf67143848

Elucidation: A foam of trapped gas in a solid.

Example: Aerogel

Relations:

- is_a materials.Foam
- is_a materials.Solid

Emulsion

IRI: http://emmo.info/emmo/middle/materials#EMMO_40e18c93_a1b5_49ff_b06a_d9d932d1fb65

Elucidation: An emulsion is a mixture of two or more liquids that are normally immiscible (a liquid-liquid heterogeneous mixture).

Example: Mayonnaise, milk.

Relations:

- is_a materials.Colloid
- is_a materials.Liquid

Liquid

IRI: http://emmo.info/emmo/middle/materials#EMMO_7509da43_56b1_4d7f_887a_65d1663df4ba

Elucidation: A liquid is a nearly incompressible fluid that conforms to the shape of its container but retains a (nearly) constant volume independent of pressure.

Relations:

- is_a materials.Fluid
- is_a materials.StateOfMatter

Smoke

IRI: http://emmo.info/emmo/middle/materials#EMMO_5a2af26d_99de_4e5e_b1cd_514be71420c3

Elucidation: Smoke is a solid aerosol made of particles emitted when a material undergoes combustion or pyrolysis.

Relations:

- is_a materials.SolidAerosol

Gel

IRI: http://emmo.info/emmo/middle/materials#EMMO_3995e22d_5720_4dcf_ba3b_d0ce03f514c6

Elucidation: A soft, solid or solid-like colloid consisting of two or more components, one of which is a liquid, present in substantial quantity.

Relations:

- is_a materials.Colloid
- is_a materials.Solid

GasMixture

IRI: http://emmo.info/emmo/middle/materials#EMMO_5be9c137_325a_43d8_b7cd_ea93e7721c2d

Elucidation: A gaseous solution made of more than one component type.

Relations:

- is_a materials.Gas
- is_a materials.Solution

SolidSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_5e77f00d_5c0a_44e7_baf1_2c2a4cb5b3ae

Elucidation: A solid solution made of two or more component substances.

Relations:

- is_a materials.Solution
- is_a materials.Solid

SolidSol

IRI: http://emmo.info/emmo/middle/materials#EMMO_5add9885_dc98_4fa5_8482_fdf9ba5e3889

Elucidation: A type of sol in the form of one solid dispersed in another continuous solid.

Relations:

- is_a materials.Sol
- is_a materials.Solid

SolidAerosol

IRI: http://emmo.info/emmo/middle/materials#EMMO_96c8d72f_b436_44e2_9f7f_085c24094292

Elucidation: An aerosol composed of fine solid particles in air or another gas.

Relations:

- is_a materials.Aerosol

AcqueousSolution

IRI: http://emmo.info/emmo/middle/materials#EMMO_5cb107ba_7daa_46dd_8f9f_da22a6eac676

Elucidation: A liquid solution in which the solvent is water.

Relations:

- is_a materials.LiquidSolution

Chapter 4

Individuals

Universe

IRI: http://emmo.info/emmo/top/mereotopology#EMMO_08cb807c_e626_447b_863f_e2835540e918

Relations:

- is_a physical.Physical

Chapter 5

Appendix

The complete taxonomy of EMMO relations

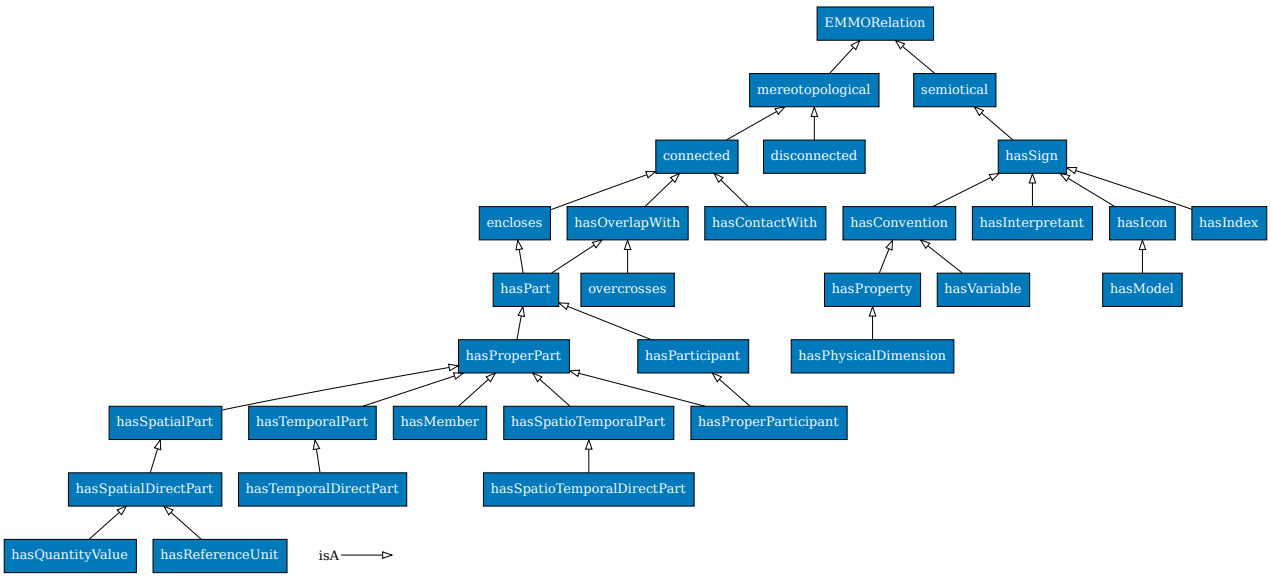

Figure 5.1: The complete taxonomy of EMMO relations.

The taxonomy of EMMO classes

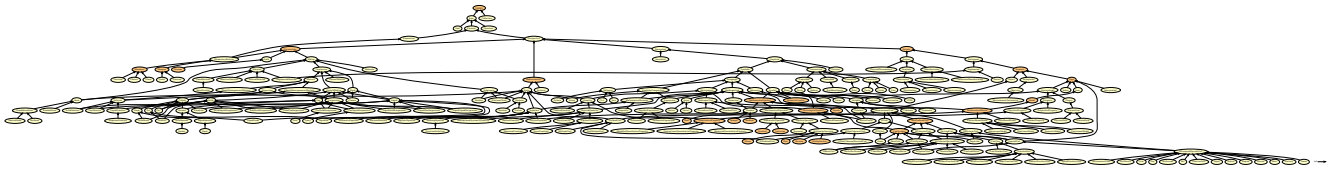

Figure 5.2: The almost complete taxonomy of EMMO classes. Only physical quantities and constants are left out.
